## 1 Introduction, Background and Process

### 1.1 Purpose of the Plan

The four member jurisdictions (Village of Marvin, Town of Waxhaw, Town of Weddington, and Village of Wesley Chapel) of the Union County Local Area Regional Transportation Plan (LARTP) Group are collectively and individually feeling the strains of tremendous growth pressure from the greater Charlotte region. As one of the fastest growing counties in the state, Union County is challenged with trying to mitigate the many impacts of this rapid growth, while proactively planning for its future. This is especially true for the towns in the western portion of the county. While growth and development bring many benefits to the community (such as new investment and jobs), they also threaten many of the values the communities want to preserve, particularly their small town character and rich rural heritage. Some of the most immediate and significant
 impacts felt by area residents are on the region's transportation system. The member jurisdictions of the LARTP Group, together with the Centralina Council of Governments and the Mecklenburg-Union Metropolitan Planning Organization, have collaborated to create a unified transportation plan to put themselves in a position of knowledge and strength when confronting growth, rather than a position of reaction and catching-up.

Past approaches to addressing the long-term transportation needs of the area have emphasized maintaining (or attempting to maintain) reasonable level of service for motorists. While impacts on quality of life have been recognized, the importance of accommodating traffic growth has typically dominated transportation decisions. Functional needs, which are obviously important, often override environmental, aesthetic, and even local economic implications. Widening a road in accordance with traditional design standards to accommodate projected traffic loads is a classic example. In many cases, there is no alternative but to increase the capacity of a road. However, the affected community may not have had an adopted plan to influence how the road is designed. Alternative modes of travel also often have been a secondary consideration, depending on available budgets and other
constraints. New developments are sometimes approved without a true understanding of direct or cumulative impacts on the transportation system, and without considering future mobility challenges. This study offers the opportunity to develop an integrated and forward-thinking transportation and land-use plan.

### 1.2 Study Area

Figure 1 shows the boundaries of the study area for the LARTP. In general, the study area is comprised of the Village of Marvin, the Town of Waxhaw, the Town of Weddington, and the Village of Wesley Chapel. Because this plan is a study of transportation systems, it is not confined to municipal boundaries. There are a number of locations between municipalities that fall under the jurisdiction of Union County. The plan also considers the area's transportation systems within the broader regional context, with special attention paid to how the LARTP area connects with and is impacted by neighboring Union County and Monroe, Mecklenburg County and Charlotte, and South Carolina to the west.

### 1.3 Summary of Key Elements

The LARTP is a multimodal plan - it attempts to balance the needs of various modes of transportation, including vehicles, bicycles, pedestrians, and transit. Since the area's roadways are currently experiencing congestion and safety issues, and because those issues are projected to get much worse in the future, the focus of the plan is on roadways and intersections. Creating viable options for using alternative modes may alleviate congestion as well as provide positive health and quality of life benefits for the community.

The key elements of the LARTP are:

- Roadways - Includes the Thoroughfare Plan, which plans for the area's long-range roadway needs, and the Intersection Plan, which makes recommendations for capacity and safety improvements for targeted intersections in the study area.
- Bicycle and Pedestrians - Opportunities for improving bicycle and pedestrian facilities and amenities are identified.
- Land Use Policies and Ordinances - Recommendations are made for new and amended land use policies and ordinances to understand and mitigate impacts of development and promote more efficient land use patterns.

To facilitate discussion and analysis of these elements, this report is organized into the following sections:

- Existing Conditions (Where We Are Now)
- Future Conditions (Where We Are Headed)
- Recommendations (Where We Want To Be), and
- Implementation Plan (How We're Going To Get There)

### 1.4 Regional Planning Context

Many transportation planning decisions are carried out at the regional level, especially where federal and state transportation improvement funds are being considered. The four LARTP member jurisdictions fall under the purview of the Mecklenburg-Union Metropolitan Planning Organization (MUMPO), one of seventeen metropolitan planning organizations (MPO) in North Carolina. MPOs are federally-mandated for communities with an urbanized population of greater than 50,000 . They are comprised of local government and transportation authorities charged with ensuring that transportation funding is allocated to projects and programs in a "continuing, cooperative and comprehensive" manner. MUMPO serves the greater Charlotte urbanized area, of which western Union County is a part, and has seventeen voting member jurisdictions and bodies. The Village of Marvin is the only municipality of the four in the LARTP study area that is not a voting member of MUMPO because it does not yet meet the minimum population threshold of 5,000.

MUMPO provides a number of services and administers a variety of programs, but perhaps the most visible is development of MUMPO's Long Range Transportation Plan (LRTP). The LRTP is a longrange blueprint for defining the MUMPO region's future transportation needs and developing projects and programs to meet those needs. The LRTP is a comprehensive and multimodal plan, considering roadway, highway, transit, rail, bicycle and pedestrian improvements, as well as other programs designed to offset the impacts of growth. The MUMPO LRTP is a fiscally-constrained plan which includes projects that have been modeled and meet the transportation needs and air quality standards for the MUMPO region. The LRTP is adopted by MUMPO and the North Carolina Department of Transportation (NCDOT) as the long-term mobility blueprint for the MUMPO region.

Another important project at the regional level is development of the MUMPO's Comprehensive Transportation Plan (CTP). The CTP is a relatively new plan developed by the NCDOT that is replacing the traditional thoroughfare plan. Like the LRTP, the CTP is a long-range multimodal plan. But unlike the LRTP, the CTP is not fiscally-constrained. Because it is not fiscally-constrained, the CTP includes more projects than the LRTP.

MUMPO is currently in the process of updating the LRTP and developing the CTP (updating the MUMPO thoroughfare plan). The projects and recommendations developed as part of the Western Union County Local Area Regional Transportation Plan will feed directly into both of these MUMPO plans. Having a unified, adopted plan for this area will be beneficial for the four municipalities as they participate in developing the MUMPO's plans.

### 1.5 Public and Stakeholder Involvement

The LARTP was developed with a significant amount of public and stakeholder involvement, recognizing that implementation of the plan will require buy-in from stakeholders from each of the four member communities. The following groups and activities were instrumental in development of the LARTP:

Steering Committee: Elected and appointed officials from each of the four member jurisdictions, together with staff and representatives from the development community and other local interests met monthly to develop each of the components of the plan.

Technical Committee: Staff from each of the four member jurisdictions, the Centralina Council of Governments, and the Mecklenburg-Union Metropolitan Planning Organization (MUMPO), met regularly with the consultant team to develop the technical aspects of the plan and "reality check" recommendations.

Public Meetings: Citizens in the study area were invited to participate at various points in the process. Attempts were made to provide information and input opportunities at various locations and settings to reach the widest audience possible. These were the main public events:

- Public Workshops: Two public workshops were held in October and November of 2008, one in Wesley Chapel and one in Weddington. Participants worked in small groups to identify issues and discuss potential solutions. They also participated in a key pad polling exercise designed to gauge opinion on a number of transportation and land use concepts (the results of the key pad polling exercise are found in Appendix A).
- Community Event Booths: On November 1, 2008, booths were set up at the Waxhaw Farmers Market and the Marvin Chili Cook-Off. Information was distributed about the plan and booth visitors had the opportunity to ask questions and provide feedback similar to the public workshops.
- Public Meeting: A public meeting was held May 27, 2009 to present the draft recommendations to the public and get feedback.

Project Website: A project website (www.lartp.org) was developed and maintained to disseminate information and provide another outlet for public comments.

## 2

## 2 Existing Conditions: Where We Are Now

### 2.1 Introduction

Union County is the fastest growing county in North Carolina and is one of the ten fastest growing counties in the United States. The western half of the county, and especially those communities adjacent to the Mecklenburg County line, has absorbed most of this growth. While this explosive growth can bring benefits to a community it can also take a tremendous toll on its infrastructure.

The communities within the LARTP study area have a rich rural heritage. The area's roadways were developed for local, rural traffic, with many of today's major thoroughfares developed originally as farm-to-market roads. Now those roads (such as Providence Road/NC 16 and NC 84) are handling significant amounts of not only local traffic, but also commuter traffic, since most of the area's residents do not work within the study area. Many of the area's roads also continue to carry large farm vehicles, which can pose safety concerns as vehicles attempt to pass them on roads with no center turn lanes and narrow or nonexistent shoulders. One of the main challenges facing these communities is developing a transportation system that adequately serves the vehicular needs of their residents and workers without compromising the rural heritage and small-town atmosphere.

This section details the existing transportation conditions in Western Union County, including describing the operating conditions of the existing transportation network in the project vicinity, the surrounding roadway network, weekday AM and PM peak hour traffic volumes, intersection performance, and collision analysis. Additionally, this chapter describes the public bicycle facilities, pedestrian facilities, and the public transit network.

### 2.2 Travel Characteristics

The communities within the study area include small towns that are rural in nature. While there is travel between different locations within the study area, there is a heavy focus of travel to and from Charlotte, which as a large urban area, attracts trips related to employment, recreation, and shopping. Based on US Census information, shown in Table 1, approximately three-quarters of all residents within the study area work outside the study area, with almost 60 percent working in Charlotte. Given the distance from the study area to outside locations of employment, the average travel time to work for residents living within the study area is approximately 30 minutes.

Table 1: Journey to Work Data

| Work Location | Study <br> Area | Monroe | Other <br> Union <br> County | Charlotte | South Carolina | Elsewhere | Average Travel Time to Work |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Study Area Residents | 26\% | 0\% | 3\% | 57\% | 6\% | 9\% | 31 minutes |

Source: US Census (2000)
As shown in Table 2, there are limited mobility options within the study area, as approximately $84 \%$ of all residents drive alone to work. Alternative modes, including carpool, walk, bicycle, and transit comprise $11 \%$ of all work-related travel. While the Census does not record information on travel mode use for any other trip purposes, anecdotal evidence indicates that an overwhelming majority of travel into, out of, and within the study area occurs via the use of private automobiles. This is based on a combination of the land use patterns in the area, distance between destinations, and the lack of viable alternative transportation options. As such, the primary focus of the following existing conditions sections primarily address vehicle traffic conditions.

Table 2: Travel Mode to Work Data

| Travel Mode | Drive Alone | Carpool | Walk/ Bicycle | Transit | Work at Home |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Study Area Residents | $84 \%$ | $10 \%$ | $<1 \%$ | $<1 \%$ | $5 \%$ |

### 2.3 Functional Classification

Different streets in the overall roadway system are designed to perform specific functions with the goal of minimizing traffic and land use conflicts, improving safety, and enhancing mobility. The road classifications described below are based on the definitions used by NCDOT for the Comprehensive Transportation Plan and their Strategic Highway Corridors. The classifications are detailed below and summarized in Table 3.

The main roadway classifications considered for the Western Union County LARTP are Thoroughfares (Major and Minor), Collectors, and Locals. There are possible sub-classifications within each. As higher-level roadways designed to carry more vehicles with more controlled access, there are no roads designated as freeways or expressways in the study area. The current functional classifications in the study area are illustrated in Figure 2. Note that in Figure 2, Boulevards are shown as Major Thoroughfares.

## Freeway

Freeways feature characteristics of high mobility and low accessibility, with full control of access. Carrying through traffic and controlling access points are of supreme importance of roadways classified in this category. Typically, freeways have a minimum of four travel lanes, are mediandivided facilities, and have posted speed limits of 55 miles per hour or greater. Traffic signals and
driveways are not permitted, as access is only permitted at existing or new grade-separated interchanges.

## Expressway

Expressways feature characteristics of high mobility and moderate to low accessibility. Moving through-traffic is an important element; however, access points are allowed, but limited. Traffic signals are not permitted, but driveway connections are permitted. It is recommended that driveways be consolidated if possible, and spaced at least 1,000 feet from one another. Typically, roadways in this category have a minimum of four travel lanes, are median-divided facilities, and have posted speed limits of $55-60$ miles per hour.

## Boulevard

Boulevards feature characteristics of moderate mobility and low to moderate accessibility. The relationship between mobility and accessibility is more balanced than that of freeways and expressways. Access control may range from limited to no control. Driveway connections are permitted. These conflict points are recommended to be consolidated if at all possible, and spaced at 1,000 feet from one another. While signalized intersections may accommodate all movements, driveways should be restricted to right-in/right-out facilities. Typically, roadways in this category have a median, but may have as few as two lanes. They have posted speed limits of $30-55$ miles per hour. Traffic signals are allowed and recommended at $1 / 2$ mile intervals.

## Thoroughfare

Thoroughfares (major and minor) feature characteristics of moderate to low mobility and high accessibility. There is no control of access in the category. Traffic signals are allowed and recommended at $1 / 2$ mile intervals. Driveways are allowed with full movement, but are still recommended to be consolidated or shared if possible. This category includes all roads with a twoway center left-turn lane, but no roads with medians. Speed limits are posted between $25-55$ miles per hour.

## Collector

Collector roads feature characteristics of moderate to low mobility and high accessibility, and serve as a link between through-roads and local roads. There is no control of access (i.e. no physical restrictions on access). Traffic signals are allowed, at a recommended minimum spacing of $1 / 4$ mile. Driveways are allowed with full movement, but are still recommended to be consolidated or shared if possible. Roadways in this category generally will have neither a center left turn lane nor a median, but may have dedicated left and right turn lanes. Speed limits are regulated at $25-45$ miles per hour.

## Local Road

Local roads are designed to provide final access to properties, rather than through movements. There is no control of access (i.e. no physical restrictions on access). Traffic signals are allowed, at a recommended minimum spacing of $1 / 4$ mile. Driveways are allowed with full movement, but are still recommended to be consolidated or shared if possible. Roadways in this category generally will have neither a center left turn lane nor a median, but have dedicated left and right turn lanes. Speed limits are regulated at 35 miles per hour or less. Some residential neighborhoods have roads that function as "local connectors". These roads are designed to provide better vehicular access through neighborhoods with more limited access than typical local streets.

Table 3: Facility Type Categories

| Functional Purpose |  |  |  | Driveway Spacing |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Facility Classification | Mobility | Access | Cross-Section | Posted Speed Limit | Control of Access | Allowability; Ideal Offset Spacing | Description | Minimum Stem Length | Median Crossovers | Traffic Signals |
| Freeway | High | Low | 4 lanes minimum with median | $\begin{gathered} 55 \mathrm{mph} \\ \text { or } \\ \text { greater } \end{gathered}$ | Full | Not Allowed | - | - | Not Allowed | Not Allowed |
| Expressway | High | Low to moderate | 4 lanes minimum with median | $\begin{gathered} 45-60 \\ \mathrm{mph} \end{gathered}$ | Limited or partial | Not allowed if limited control of access Allowed if partial control of access | If Partial Control of Access: One driveway per Parcel. Consolidate and/or Share Driveways and Limit Access to Connecting Streets or Service Roads; Restrict to Right-in/Right-out only | 100 feet | Allowed; <br> 2,000’ spacing if $>45 \mathrm{mph}$ <br> 1,000’ spacing if $\leq 45 \mathrm{mph}$ | Not Allowed |
| Boulevard | Moderate | Moderate to low | 2 lanes minimum with median | $\begin{gathered} 30-55 \\ \mathrm{mph} \end{gathered}$ | Limited, partial, or no control | Not allowed if limited control of access Allowed if partial control of access | If Partial Control of Access: One driveway per Parcel. Consolidate and/or Share Driveways and Limit Access to Connecting Streets or Service Roads; Restrict to Right-in/Right-out only | 100 feet | Allowed; <br> 2,000’ spacing if $>45 \mathrm{mph}$ <br> 1,000’ spacing if $\leq 45 \mathrm{mph}$ | Allowed; <br> 1/2-mile ideal spacing |
| Thoroughfare | Moderate to low | High | 2 lanes minimum without median; includes facilities with two-way leftturn lane | $\begin{gathered} 25-55 \\ \mathrm{mph} \end{gathered}$ | No | Allowed; <br> 1,000 feet | Consolidate or Share Connections, if possible | 100 feet | Not applicable | Allowed; <br> 1/2-mile ideal spacing |
| Collector | Moderate to low | High | 2 lanes minimum without median; includes facilities with two-way leftturn lane | $\begin{gathered} 25-45 \\ \mathrm{mph} \end{gathered}$ | No | Allowed; 600 feet | Consolidate or Share Connections, if possible | 100 feet | Not applicable | Allowed; 1/4-mile minimum spacing |
| Local | Low | High | 2 lanes minimum without median | 35 mph or less | No | Allowed; 100 feet | Consolidate or Share Connections, if possible | 100 feet | Not applicable | Allowed; <br> 1/4-mile minimum spacing |

### 2.4 Roadway Traffic

Roadway traffic conditions within the study area have rapidly changed over the past ten years. The conversion of the study area from primarily a rural region to one that is more suburban in nature has led to increased daily traffic levels. As shown on Figure 3, the roadways that are most heavily utilized include the following major routes:

- NC 16
- NC 75
- NC 84
- Rea Road
- New Town Road, west of NC 16
- Waxhaw Indian Trail
- Old Waxhaw Monroe
- Forest Lawn Road

The level of traffic on each of the above roadways is directly related to the proximity to Charlotte, which represents the most predominant destination outside of the study area. For example, NC 16 has approximately 17,800 daily vehicles along the section north of NC 84 , while there are only approximately 9,000 daily vehicles along the section north of downtown Waxhaw. Additionally, the geography of the study area, which allows for many parallel east-west roads and fewer north-south options, leads to higher concentrations of traffic along the major north-south roads. Outside of the NC highway system, most of the roadways within the study area were not designed to handle the level of traffic that typical travel along them under current conditions.

### 2.5 Intersection Traffic

Traffic operations at intersections are typically described in terms of "level of service" (LOS). LOS is a qualitative measure of the effect of several factors on traffic operating conditions including speed, travel time, traffic interruptions, freedom to maneuver, safety, driving comfort, and convenience. It is generally measured quantitatively in terms of vehicular delay and described using a scale that ranges from LOS A, the best operating conditions, to LOS F, the worst operating conditions. LOS D or better represents "acceptable" operations. LOS E represents "at-capacity" operations. When traffic volumes exceed capacity, stop-and-go conditions result, and operations are designated as LOS F. LOS standards and descriptions for intersections are shown in Table 4.

Table 4: Levels of Service Description for Intersections

| Level of Service |  | Description | Signalized Intersection |
| :---: | :---: | :---: | :---: |
| A | Little or no delay | $<=10 \mathrm{sec}$. | $<=10$ sec. |
| B | Short traffic delay | $10-20$ sec. | $10-15$ sec. |
| C | Average traffic delay | $20-35$ sec. | $15-25$ sec. |
| D | Long traffic delay | $35-55 \mathrm{sec}$. | $25-35$ sec. |
| E | Very long traffic delay | $55-80$ sec. | $35-50$ sec. |
| F | Unacceptable delay | $>80 \mathrm{sec}$. | $>50$ sec. |

Weekday morning and evening peak hour intersection turning movement counts were compiled from AM (7:00 to 9:00 AM) and PM peak period data (4:00 to 6:00 PM) at the following intersections within the study area, as shown on Figure 4:

- Antioch Church Road and Beulah Church Road (unsignalized)
- Bonds Grove Church Road and Waxhaw Marvin Road (unsignalized)
- Broome Street and North Main Street (unsignalized)
- Broome Street and South Main Street (signalized)
- Broome Street and McDonald Street/Howie Mine Road (signalized)
- Crane Road and New Town Road (signalized)
- Deal Road and Weddington Road (unsignalized)
- Marvin Road and New Town Road (unsignalized)
- Marvin School Road and New Town Road (unsignalized)
- Potter Road and Forest Lawn Drive (unsignalized)
- New Town Road and Potter Road (unsignalized)
- South Main Street/Old Providence Road and Waxhaw Road (unsignalized)
- Twelve Mile Road and Weddington Road (signalized)
- Waxhaw Marvin Road and Kensington Road (unsignalized)
- Waxhaw Marvin Road and New Town Road (unsignalized)
- Weddington Matthews Road and Tilley Morris Road (unsignalized)
- Potter Road and Wesley Chapel Road (unsignalized)
- Providence Road and Weddington Road (signalized)
- Waxhaw Indian Trail Road and New Town Road (signalized)
- Waxhaw Indian Trail Road and Weddington Road (signalized)

Counts used in this report were collected during October 2008 while local public schools were in session. LOS were calculated at each study intersection for the weekday AM and PM peak hour (see Appendix A for detailed level of service calculations). Figures 5 and 6 show the results of the LOS analysis.

As shown on Figures 5 and 6, all signalized intersections operate at acceptable LOS D or better during both the A.M. and P.M. peak hours. Only two of the six signalized intersections perform at LOS D during either the A.M. or P.M. peak, along Weddington Road at Twelve Mile Creek Road and Weddington Road and Waxhaw Indian Trail Road. The two signalized intersections along New Town Road, at Crane Road and Waxhaw Indian Trail Road, performed best, with LOS B conditions during A.M. and P.M. peak hours in both cases.

Unsignalized intersections within the study area operate at acceptable levels of service during both the A.M. and P.M. peak hours, with a few exceptions. The westbound Howie Mine Road approach to Broome Street in downtown Waxhaw operates at a failing LOS E in the P.M. peak hour, for instance, while the northbound Weddington Matthews Road approach to Tilley Morris Road operates at LOS F during the A.M. peak hour.

Three unsignalized intersection approaches operate at unacceptable LOS (LOS E or F) during both A.M. and P.M. peak hours, namely the southbound Deal Road approach to Weddington Road, the northbound Waxhaw Marvin Road approach to New Town Road and the eastbound Potter Road approach to Wesley Chapel Road. All of these intersections warrant traffic signals according to Manual on Uniform Traffic Control Devices (MUTCD) Peak Hour criteria, which uses travel time

Figure 4: Traffic Count Locations

Figure 5: Intersection Level of Service (AM Peak)

Figure 6: Intersection Level of Service (PM Peak)
delay, approach volumes, and other factors to determine if the construction of a signalized intersection would provide a benefit to all users of the intersection.

### 2.6 Traffic Safety

NCDOT collision records for a three-year period (October 2005-October 2008) were analyzed for 20 study area intersections, most of which correspond to the previously identified intersection count sites. As shown in Figure 7, a total of 403 collisions occurred, of which 159 ( 39.5 percent) were reported as causing non-fatal injuries, 243 ( 60.3 percent) as causing property damage only and one ( 0.2 percent) as fatal. Figure 8 depicts the number of accidents at each study area intersection by type; overall, angle, left-turn and rear-end crashes were most common.

The fatal collision occurred at Weddington Matthews Road and Beulah Church Road, an angled intersection of higher-speed two-lane roads with narrow shoulders at which most collisions were angle- or left turn-related. Here, wide right-turn radii may encourage motorists to execute faster turns without paying close attention to approaching traffic, while a hollow along Weddington Matthews Road to the north of the intersection may restrict the visibility of motorists turning left from that road. Also, rear-end collisions may occur due to abrupt deceleration when approaching the intersection.

Several other intersections at which numerous injurious collisions occurred over the three-year period are configured similarly and experienced similar types of collisions, although angles of intersection and surrounding grades vary. In addition to the high travel speeds and scant shoulders, sight distances at some intersections are poor due to trees, shrubbery and tall field grass adjacent to the roads. Such intersections include Waxhaw Indian Trail Road and New Town Road, which recorded the greatest number of injurious collisions (24); Crane Road and New Town Road, where the second-highest number occurred (20), and where a new signal was recently installed; Antioch Church Road and Beulah Church Road, where one collision involved a roadside object; and New Town Road and Potter Road.

Collision patterns at some intersections deviated from those of the overall study area. At Weddington Road and Twelve Mile Creek Road, for instance, right-turn collisions were more common and may be caused by motorists pulling too far into the intersection when seeking a gap in which to turn right. At Waxhaw Marvin Road and Kensington Drive, a greater incidence of head-on and runoff collisions may result from the intersection's odd turn lane configuration. Motorists traveling westbound through the intersection must correct their direction slightly to stay on the road, while those turning from westbound Kensington Drive onto southbound Waxhaw Marvin Road may not anticipate through traffic in the left lane of eastbound Kensington Drive. Finally, collisions tended to be less severe in downtown Waxhaw, perhaps due to lower travel speeds; a greater share of collisions classified as "other" occurred in this area as well.

Figure 7: Vehicular Collisions (by Severity)

### 2.7 Bicycles

As noted previously, the area's rural heritage has played a major role in defining the development of its transportation systems. Just as the rural roads were not originally designed and built to carry today's traffic, they were also not designed to accommodate bicycle users. While advanced bicyclists may ride the roads, perhaps on group rides on weekends, most residents do not bicycle outside their neighborhoods, in large part because there are few dedicated bicycle facilities.

## Bicycle Facility Types

There are two general classes of bicycle facilities: on-street (bike lanes, wide outside lanes, wide shoulders) and off-street (greenways and multi-use paths). There are currently no striped and marked on-street bike lanes in the study area. Rea Road west of Providence Road/NC 16 has wide outside lanes that accommodate bicycles on-street, and the new section of Providence Road/NC 16 will have wide outside lanes with striped bike lanes through intersections when completed.

A system of greenway trails can supplement on road bicycle facilities. Greenways often connect points of interest more directly than roadways and are designed for recreational uses. Greenway planning differs from on-street bicycle facility planning, however, because it typically involves developing and adopting a separate greenways master plan. To date, the only adopted greenways plan within the study area is the Village of Marvin Parks and Greenways Master Plan. The Village of Wesley Chapel's Master Plan includes some conceptual locations for potential greenways.

## Marvin Greenways

The only existing greenway trail section within the study area is approximately 0.75 miles long, connecting residences along a portion of Joe Kerr Road and Marvin School Road toward Marvin Elementary School. The Marvin Parks and Greenways Master Plan calls for extension of this segment.

## Bicycle Riding Clubs

Riding clubs are common recreational activities for urban and suburban communities. The purpose of these clubs is to promote awareness for on-road cycling in the area, demonstrate need for future bicycle facilities, and to meet individuals who share common interests in cycling. The NCDOT lists at least four participating bicycle clubs in the greater Charlotte area, and other internet resources identify meeting locations and information on specific bicycle clubs that regularly ride through the study area on weekends. Clubs with advanced riders often ride in groups on weekends. These advanced groups may take a full lane of traffic while riding and typically travel long distances.

## Existing Facilities in Neighboring Jurisdictions

The City of Charlotte Bicycle Plan (2008) indicates several major and minor thoroughfares that are suitable for bicycle facilities, extending into the study area. Mecklenburg County also has an established greenway trail along the Six Mile Creek corridor, which serves as the county boundary between Union and Mecklenburg counties. The existing trail is 0.9 miles long, with future considerations for more than five miles of expansion and further connections with residential areas. Refer to Figure 9 for the existing (dark-green solid line) and potential (light-green dashed line) greenways within neighboring jurisdictions.

Figure 9: Existing Greenway Facilities

### 2.8 Pedestrians

Pedestrian facilities are essential elements of every transportation mode because every type of trip (vehicular, transit, or bicycle) begins and ends with some amount of walking. Pedestrian facilities are important to communities as a measure of walkability, which contributes to the overall health, safety, and quality of life of the community. Pedestrian facilities also serve to connect points of interest that may not be directly connected by roadways or other modes.

## Sidewalks

Western Union County is predominantly rural, low-density residential in character. Many of the residential neighborhoods, and especially newer neighborhoods, have sidewalks, but many do not. There are also few sidewalk connections between neighborhoods, making it more difficult to make short walking trips and encouraging driving. Pedestrian connections to local schools from adjacent and nearby neighborhoods are also limited.

Of the four municipalities in the study area, Waxhaw has the most developed downtown area. Downtown Waxhaw has a sidewalk network, as well as a pedestrian bridge over the railroad tracks, that moves people throughout the downtown. Some pieces of that network are incomplete, however, and street crossings, due to high vehicular, truck, and train traffic, can be difficult, especially during the peak hours. There are also stretches of sidewalk on Providence Road/NC 16 to the north of downtown Waxhaw, and the widened section of Providence Road/NC 16 in the northern section of the study area will have sidewalks on both sides.

## Intersections

In general, intersections within the study area lack treatments to accommodate pedestrians safely, such as high visibility crosswalks, pedestrians signal heads, and other appropriate signage and markings. Recently improved intersections, such as those along the Providence Road/NC 16 corridor, have incorporated these treatments.

### 2.9 Transit

Transit options within the study area are limited, as there is no fixed-route service available. However, Union County Transportation operates community transportation service, which is demand-responsive and primarily focused on human and social service agencies. Transit options for work trips include Charlotte Area Transit System (CATS) vanpools (Waxhaw to Airport, $3^{\text {rd }}$ Shift and Indian Trail to Uptown, $1^{\text {st }}$ Shift) and ridesharing opportunities through various Charlotte area websites. Additionally, CATS operates the following bus lines near the northern edge of the study area:

- 43 Local - US 521 @ Ballantyne Corp Plaza
- 61 Express - Hwy 16 @ Promenade Shop Center
- 62 Express - Rea Rd @ St. Matthew Church Park and Ride
- 74 Express - US 74 @ Union Town Center Park and Ride

As is common in non-urban areas, residents of the study area must drive personal vehicles in order to access transit service. Even if fixed-route bus service where available within the study area, the bicycle and pedestrian facilities are limited and would likely still require the use of a personal vehicle to access transit.

## 3 Future Conditions: Where We Are Headed

### 3.1 Growth

Western Union County has already experienced tremendous growth, which has created some of the transportation conditions detailed in Section 2. As the region continues to grow, and more particularly as Western Union County continues to offer a high quality of life, the issues faced today will become more exaggerated and more difficult to solve.

Figure 10 illustrates the projected change in population from 2000 to 2030. The data is derived from the Metrolina Regional Travel Demand Model and is broken into geographic areas called Traffic Analysis Zones. Figure 11 shows projected change in employment levels for the same time period.

The main points of these figures are:

- Population and employment growth will continue to concentrate along major transportation corridors, particularly along NC 16 and NC 84.
- The southern portion of the study area, and especially Waxhaw, will receive the highest proportionate amount of growth.
- Weddington, and to a lesser extent Wesley Chapel, will have the lowest growth levels.
- Western Union County will continue to be primarily residential, with few significant employment opportunities. The highest concentrations of new employment opportunities are expected to be in the Waxhaw area.

These projections are based on a combination of factors, including approved and anticipated new development, vacant or underdeveloped land, and other constraints, such as environmental features. The land use policies, ordinances, and decisions discussed in Section 5 will have a direct impact on future development patterns.

### 3.2 Roadways

The Mecklenburg-Union County Metropolitan Planning Organization (MUMPO), the lead transportation planning agency for the study area, is charged with developing future transportation plans, including the following:

- Long Range Transportation Plan (LRTP)
- Transportation Improvement Plan (TIP)
- Unified Planning Work Program
- Thoroughfare Plan/Comprehensive Transportation Plan (CTP)

These plans, developed at the local level and balanced with regional needs, are provided to NCDOT, which is responsible for developing statewide TIPs on a seven-year implementation basis. The planned transportation improvements in the area are shown on Figure 12, based on the current MUMPO LRTP and NCDOT 2009-2015 TIP.

As shown, the planned transportation improvements are limited within the study area and focus on the major roadways. While there are some intersection and safety improvements, the main focus is providing additional capacity along the major east-west and north-south NC highways. These roadways handle both local and regional traffic (through the study area) and were identified for inclusion in the MUMPO LRTP and NCDOT TIP based on the desire to enhance regional travel options. It should be noted that the identified improvements do not have guaranteed sources of funding.

As shown on Figure 13, traffic levels will greatly increase within the study area by the year 2030. Daily traffic along the major routes will increase as much as $100 \%$, with some additional traffic attributed to future development within the study area, but predominantly due to increased regional travel though the study area.

The planned widening and new construction projects will help to alleviate some congestion associated with the additional regional travel, but the minor routes and local roads will also experience traffic increases between $50-100$ percent. This traffic is exclusively local to the study area, from future development, or existing traffic that shifts from the major facilities to the minor ones due to the increase in regional traffic. Without the implementation of local roadway and intersection improvements, the existing roadway system in the study area will not be able to handle the future traffic levels.

Figure 12: Planned Roadway Projects

### 3.3 Bicycles

## On-Street Bicycle Facilities

It is anticipated that on-street bike lanes/wide outside lanes will be included as part of the NC 16 and NC 84 widening projects and the Rea Road Extension project that are part of the TIP and shown in Figure 12. There are also other smaller-scale widening projects in the TIP and MUMPO LRTP that would likely have on-street bicycle facilities, both within the study area and nearby. There are no other planned on-street bicycle facilities planned that are not part of this LARTP project.

## Off-Street Bicycle Facilities and Greenways

## Village of Marvin

The Village of Marvin adopted its Parks and Greenways Master Plan in March 2008, identifying trails as either Tier I ( 8 miles of trails) , or Tier II ( 16 miles of trails). Tier I trails serve as the backbone of the proposed greenway system, whereas the Tier II trails would serve as connectors and loop trails. Greenway trail widths recommended by this plan range from $8^{\prime}$ to $12^{\prime}$ to accommodate bicyclists, pedestrians, and horses. These trails are illustrated on Figure 14.

## Village of Wesley Chapel

The Village of Wesley Chapel Master Plan included concepts for a greenway system. While not a formally adopted greenway plan, the concepts are useful in planning for potential future facilities. These potential greenway corridors are illustrated on Figure 14.

## Carolina Thread Trail

The Carolina Thread Trail is a plan for a regional, 15 -county greenway trail network, centering on Charlotte and Mecklenburg County. The concept is to link regional parks, green space, and attractions by a series of greenway trails, and "weaving communities together." Since the organization is regional, and the trail alignments are meant to be conceptual at this stage, the exact locations of possible future trails have not been determined. All representations of the Carolina Thread Trail (see Figure 14) within this report and study area are conceptually illustrated.

### 3.4 Pedestrians

Similar to the planned on-street bicycle improvements in Section 3.3, sidewalks and intersection improvements are planned for the study area's TIP and LRTP projects. The four municipalities are also working with the NCDOT on spot intersection improvement projects to enhance pedestrian and vehicular safety. The Town of Waxhaw was recently awarded a federal stimulus grant to make improvements to the intersection of NC 16 and NC 75 in downtown Waxhaw.

### 3.5 Transit

There are no plans for extending mass transit into the study area, although planned future Charlotte transit extensions would come closer to the study area (to Matthews) and make it easier for Western Union County residents to use transit. An express shuttle from Waxhaw to downtown Charlotte has been discussed but is not currently funded.

Figure 14: Planned Bicycle and Greenway Facilities

## 4 Recommendations: Where We Want To Be

### 4.1 Introduction

This section provides recommended roadway, intersection, bicycle, pedestrian, and transit improvements that provide short-term fixes for current problems and long-term solutions for future concerns. The recommendations are brought together in Section 6 (Implementation Plan).

### 4.2 Thoroughfare Plan

The recommended Thoroughfare Plan is illustrated in Figure 15. The Thoroughfare Plan was developed through an iterative process that involved: analysis of existing and projected traffic volumes and roadway capacities; analysis of existing and projected intersection conditions; examination of the functional classification system (described in Section 2); analysis of environmental issues and other constraints; and discussion, analysis, and review by the project's Technical and Steering Committees.

The Thoroughfare Plan is a system plan - it is intended to improve roadway conditions across the entire study area. While the local needs of each of the four jurisdictions were an important part of the plan, the overriding concern was to develop a plan that benefited the study area as a whole. The plan also recognizes that the majority of the proposed roadway projects are not isolated within a single jurisdiction. Indeed, the nature of thoroughfares is that they are cross-jurisdictional.

It is also important to remember that thoroughfare plans are long-range plans. The purpose of the plan is to comprehensively identify and define future roadway needs. It is recognized that not all of these projects can be built in the short-term. But having these projects on an adopted thoroughfare plan can:

- Help communities work cooperatively to solve issues of joint concern;
- Identify right-of-way needs to help plan and fund roadway improvements that are part of new development;
- Raise the profile of regionally significant projects in the regional transportation planning process; and
- Help create common expectations among local leaders, the development community, and residents and property owners.

Individual projects on the Thoroughfare Plan (Figure 15) are identified by numbers which correspond to project descriptions on the recommendations table. The map illustrates three general roadway classifications applicable to the study area: Boulevards; Major Thoroughfares; and Minor Thoroughfares. The characteristics of these roadways types are described in detail in Section 2 of this report. The Thoroughfare Plan does not include local roads, which are primarily streets in residential neighborhoods.

Within each of the roadway classifications are three levels of projects:

- Existing - Roadway facilities that are not recommended to be improved. They are shown as solid lines on the map to show how the recommended improvements tie into the broader system.
- Needs Improvement - Roadway facilities that need to be improved for capacity, safety, or system continuity. The improvement to the facility may be widening, other operational strategies, increasing the level of access control along the facility, or a combination of improvements and strategies. "Needs Improvement" does not refer to the maintenance needs of existing facilities.
- Recommended - Roadway facilities on new location that are needed in the future. It is important to note that the projects shown as "Recommended" on the map (with dashed lines) are conceptual alignments drawn to show needed connections and general locations. Further detailed design and engineering will be required to determine precise locations and alignments as those projects draw closer to development.

Figures 16-19 show the same Thoroughfare Plan magnified for each of the four municipalities.

## Project Prioritization

Table 5 details each of the recommended roadway projects on the Thoroughfare Plan map and prioritizes each as either High, Medium, or Low Priority projects. It is important for future planning purposes to prioritize projects in order to maximize limited funding opportunities and ensure that the highest impact projects receive first focus. The table is expanded further in Section 6 (Implementation Plan).

Following Table 5, Figure 20 illustrates the project prioritization. In general, the High Priority projects include the widening projects of the major NC routes (NC 16, NC 84, and NC 75/Waxhaw Parkway). As the major existing and future travel routes, these projects need to be improved first to improve through travel and allow the secondary roads to function as they are intended. The Medium Priority projects are those that, when, improved, will provide viable alternatives to driving on the major routes, for both through and local trips. These include major east-west routes, such as New Town Road, and north-south routes, such as Waxhaw-Indian Trail, and may include new and existing collector streets that help connect local roads to the major routes. The Low Priority projects are typically projects of local importance that may not have the same regional benefits as the High and Medium Priority projects.

Table 5: Recommended Thoroughfare Plan Projects (Prioritized)

| Map ID | Facility and Section | From | To | Description |
| :---: | :---: | :---: | :---: | :---: |
| High Priority Projects |  |  |  |  |
| H1 | NC 84 Relocation (Rea Rd Extension) | NC 16 / Providence Road(SR1392) | NC 84 / Weddington Road | Construct 4-lane boulevard |
| H2 | NC 84 / Monroe-Weddington Road / Weddington Road | NC 84 Relocation | Waxhaw-Indian Trail Road (SR 1008) | Widen to 4-lane boulevard |
| H3 | NC 84 / Monroe-Weddington Road / Weddington Road | Waxhaw-Indian Trail Road (SR 1008) | Study Area Boundary East | Widen to 4-lane boulevard |
| H4 | NC 16 (Providence Rd) | Rea Road Extension / NC 84 | New Town Road (SR 1315) | Widen to 4-lane boulevard |

## Street Design

While the location of future roadway improvements is obviously critical, just as important is defining the design, character, and other attributes of those roadways. The cross-sections illustrated in Figure 21 detail five general types of roadways recommended in the Thoroughfare Plan:

- 4-Lane Divided with Wide Outside Lanes (Boulevard)
- 3-Lanes with Wide Outside Lanes
- 2-Lanes with Bike Lanes
- 2-Lanes with Paved Shoulders
- 2-Lanes with Off-Street Multi-Use Path

The cross-sections are designed to be multimodal, accommodating vehicles, bicycles, and pedestrians within the same right-of-way. Bicycles are either accommodated in wide outside lanes, striped bike lanes, paved shoulders, or a separate multi-use path (each is described in more detail in Section 4.4). Pedestrians are accommodated either on sidewalks or multi-use paths. It is recognized that in some locations with rural 2-lane roads it may not be feasible to have sidewalks on one or both sides of the road.

These cross-sections are intended to be customized to individual projects according to local context and conditions. The right-of-way requirements are useful especially in working with the development community in building new roadways and making improvements to existing roadways.

### 4.3 Intersection Plan

An important companion to the Thoroughfare Plan is the Intersection Plan, illustrated in Figure 22 and detailed below in Table 6. As shown in Section 2, some of today's intersections have capacity and safety issues while others are projected to have more serious issues in the future. These issues have a major impact on the overall function of the region's roadway network. Intersection improvements have two benefits over major roadway improvement projects; 1) they can have immediate impacts on improving capacity and safety without having to go through the same extensive planning, design, and funding process as road widening and new roads, and 2) they are considerably more cost-effective. While intersection improvements may not cure all of the system's capacity deficiencies in the long-term, they are an effective tool for making immediate short-term improvements.

There are a variety of types of potential intersection improvements, including: adding turn lanes, improving signal timing and coordination, access management, realigning offset intersections, making geometric and sight distance improvements to enhance safety, and in some locations, installing roundabouts. Similar to the roadway projects, intersection projects were prioritized into High, Medium, and Low Priority projects for ease of implementation.

Table 6: Recommended Intersection Projects (Prioritized)

| ID | Intersection | Description |
| :---: | :---: | :---: |
| High Priority Projects |  |  |
| X2 | Weddington-Matthews Road @ Hemby Road | Improve intersection (turn lanes, <br> signalization/timing, channelization, etc -- as warranted); consider installing roundabout |
| X4 | Weddington Road @ Weddington Matthews Road \& @ Providence Road; <br> Providence Road @ Weddington School Road | Improve intersections \& coordinate operations; manage access \& permitted movements; realign/consolidate if feasible |
| X6 | Beulah Church Road and Antioch Church Road | Improve intersection (turn lanes, signalization/timing, channelization, etc -- as warranted) |
| X8 | NC 84 / Weddington Road @Twelve Mile Creek Road | Improve intersection; coordinate with Baron Hills and Skytop Road intersections |
| X10 | NC 84 / Weddington Road @ Waxhaw-Indian Trail Road, \& @ Antioch Church Road; Waxhaw-Indian Trail Road @ Billy Howey Road | Improve intersections \& coordinate operations; manage access |
| X12 | New Town Road @ Marvin School Road; Waxhaw-Marvin Rd @ New Town Rd | Improve intersections \& coordinate operations; manage access \& permitted movements; realign/consolidate adjacent intersections if feasible, consider installing roundabout or pair of roundabouts |
| X14 | New Town Road from Cuthbertson Road to Will Plyler Road; Cuthberson Road @ Farm Creek Road | Improve intersections \& coordinate operations; manage access \& permitted movements; realign/consolidate where feasible |
| X15 | New Town Road and Waxhaw Indian Trail Road | Improve intersection (turn lanes, signalization/timing, channelization, etc -- as warranted) |
| X18 | Waxhaw-Marvin Road @ Bonds Grove Church Road | Improve intersection (turn lanes, signalization/timing, channelization, etc -- as warranted) |

| X21 | NC 75 @ Old Providence Road, \& @ McCain Street | Improve intersections \& coordinate operations; manage access \& permitted movements; realign/consolidate where feasible |
| :---: | :---: | :---: |
| X26 | Weddington-Matthews Road @ Tilley Morris Road | Improve intersection (turn lanes, signalization/timing, channelization, etc -- as warranted) |
| Medium Priority Projects |  |  |
| X7 | Waxhaw-Indian Trail Road @ Beulah Church Road, \& @ Potters Road; <br> Beulah Church Road @ Potters Road | Improve intersections \& coordinate operations; manage access \& permitted movements |
| X9 | NC 84 / Weddington Road @ Deal Road | Improve intersection (turn lanes, signalization/timing, channelization, etc -- as warranted) |
| X11 | Wesley Chapel Road @ NC 84 / Weddington Road, \& @ Potters <br> Road; Potters Road @ Chambwood Road | Improve intersections \& coordinate operations; manage access; consider connecting Antioch Church \& Billy Howey Roads |
| X16 | New Town Road @ Billy Howey Road, \& @ Chambwood Road | Improve intersections \& coordinate operations; manage access |
| X17 | New Town Road @ South Potter Road | Improve intersection (turn lanes, signalization/timing, channelization, etc -- as warranted) |
| X19 | Kensington Drive @ Waxhaw-Marvin Road | Improve intersection (turn lanes, signalization/timing, channelization, etc -- as warranted) |
| X20 | Rea Rd @ Tom Short Rd | Improve intersection (turn lanes, signalization/timing, channelization, etc -- as warranted) |
| X22 | New Town Road @ Marvin Road, \& @ Meadowlark Lane | Consider installing roundabout |
| X24 | New Town Road @ Twelve Mile Creek Rd | Improve intersection (turn lanes, signalization/timing, channelization, etc -- as warranted) |
| Low Priority Projects |  |  |
| X1 | Antioch Church Road @ Forest Lawn Drive | Improve intersection (turn lanes, signalization/timing, channelization, etc -- as warranted); consider installing roundabout |
| X3 | Potter Road and Forest Lawn Road | Improve intersection (turn lanes, signalization/timing, channelization, etc -- as warranted) |
| X5 | Beulah Church Road @ 12 Mile Creek Road, \& @ Huntington Road | Improve intersections \& coordinate operations; realign/combine into single intersection |
| X13 | New Town Road and Crane Road | Improve intersection (turn lanes, signalization/timing, channelization, etc -- as warranted) |
| X23 | Waxhaw Marvin Road @ Crane Road | Improve intersections; sight distance and safety improvements |
| X25 | Weddington-Matthews Road @ Cox Road | Improve intersection (turn lanes, signalization/timing, channelization, etc -- as warranted) |

### 4.4 Bicycle Recommendations

As noted in Section 2, the LARTP study area has been developed with rural roadways and lacks significant on-street and off-street bicycle facilities. One of the challenges of planning bicycle facilities in areas like Western Union County is attempting to balance the needs of bicyclists and making bicycling a viable alternative to driving with the strong desire to maintain the rural heritage of the community and its transportation system. It is recognized that formal bicycle facilities may not be appropriate on all Western Union County roadways. This Plan enhances bicycling, both for recreational and travel purposes, in two main ways: by developing on-street bicycle facilities (see types below) along major corridors (eg, NC 16, NC 84, Waxhaw Parkway, and in the Village of Marvin), and by proposing targeted off-street improvements, such as a multi-use path along New Town Road (see thoroughfare plan in Figure 15 and street cross-sections in Figure 21).

In order to understand the recommended bicycle improvements it may be helpful to first understand the different types of bicycle users and the various facilities that can accommodate them.

## Typical Bicycle Users

There are three general categories of bicyclists:

- Advanced: The advanced cyclist may represent the smallest population group, however they will ride the greatest number of miles per year and will likely be advocates for cycling opportunities at all skill levels. This category of cyclist feels comfortable traveling along thoroughfares that are predominantly automobile-oriented, at higher vehicular speed and volume.
- Basic: The basic cyclist is less confident or experienced as the advanced, and would therefore prefer to ride along on-street facilities with lower vehicular speed, or off-road path facilities. This category of rider will typically represent a greater population than then advanced, however will not ride as many miles or be as vocal in regards to community bicycle facilities and amenities.
- Children: The child cyclist has limited speed, vision, and overall comfort with regard to riding along with vehicles. This category of riders will represent the greatest population, however they will ride the smallest number of miles, and typically choose off-road multi-use path facilities or subdivision sidewalks to ride along.

## Bicycle Facility Types

Different types of facilities are designed to accommodate the three general categories of users. The following are common facility types and may be appropriately applied in the study area:

## Wide outside lanes

These types of facilities are generally preferred by the advanced cyclists because they allow the rider to operate within the lane, as a vehicle, at the posted speed limit. This facility is not striped, and may or may not include a curb and gutter. The typical outer lane minimum width is $14^{\prime}$ for a multi-lane roadway, or $15^{\prime}$ minimum width for a two-lane roadway, and does not include the width of a curb
and gutter. Because the cyclist is allowed to operate as a vehicle, this type of facility is only recommended for roadways with moderate vehicle speeds for safety.

Paved shoulders / Bike lanes
These types of facilities may provide improved bicycle safety and comfort by dedicating a (preferred) minimum $4^{\prime}$ of pavement, generally with striping, along the roadway. While bike lanes and paved shoulders are different facility types, they are included together here for application in this study area. Basic and advanced cyclist users may prefer this type of facility because of the perceived added rider safety and comfort. There are a variety of design standards for bike lanes, depending on the local context.

## Signed bike routes

This facility type includes the installation of signage along lower speed or volume (neighborhood) roadways that would otherwise not warrant extra pavement or striping. These facilities may not always provide direct routes for cyclists, and therefore may not be preferred by advanced cyclists. The signs are cost-effective treatments for slowing vehicular traffic along a neighborhood street, improving rider safety, and even improving wayfinding between neighborhood links and greenway trails.

## Shared lane markings

This type of pavement marking is also commonly referred to as a "Share the road arrow" or its contraction, "Sharrow." This application is used in combination with either a wide outside lane or a striped bike lane in order to clearly indicate that bicycle riders are encouraged to ride 'here,' and in this direction. Sharrows may also be used to increase vehicular awareness of cyclists along roads that do not meet the preferred minimum lane width of $14^{\prime}$.

## Multi-use paths

This type of facility is a separated, paved pathway that is generally a $10^{\prime}$ wide minimum width, and excludes motorized vehicles through the use of gates or bollards. Multi-use paths are shared use, mixing bicycle riders of all user groups with pedestrians, and usually located within the roadway right-of-way. This type of facility can be utilized by all types of users, however may not be preferred by an advanced cyclist, who may still choose to ride with traffic at a moderate posted speed limit. Amenities such as benches, wayfinding signage, managed vegetation (shade), or designated restroom locations are common along this type of facility. Frequent curb-cuts for driveways or intersections should be minimized or bypassed, if possible, so that the flow of cyclists along the path is maintained.

## Ancillary bicycle facilities

There are additional considerations for improving bicycling, which extend beyond the on- or offstreet paved facilities. These ancillary facilities would include bicycle parking and/or storage lockers, bike racks on transit buses, shower facilities within office buildings, or bike-friendly storm drain inlets and railroad crossing treatments.

## Bicycle parking

Bicycles, much like vehicles, need a place to park upon reaching a destination. Many bicyclists prefer covered parking locations to uncovered ones, if available. Considerations for location, capacity, security, and design should all be weighed when selecting and installing bike parking.

## Complementary facilities for bike commuters

When specifically accommodating bicycle commuters, there are considerations to be made for transit providers to include bicycle racks on buses. Some racks are front-mounted on the bus, while other designs convert seating in the rear of the bus or train to accommodate a small bike rack. This type of amenity will allow commuters to shorten the distance between a fixed bus stop location and their office destination, and increase transit ridership potential. Additionally the inclusion of changing and shower facilities at work support bicycle commuting possibilities.

## Retrofit roadway opportunities

On-street barriers to bicycling include non-bicycle-friendly storm drain inlets, uneven railroad crossings, and road debris collection along the curb and shoulder of roadways. Resources through the Association of Pedestrian and Bicycle Professionals and other state or federal organizations provide design specifications that help communities design retrofit solutions to many of these problems.

## Recommendations

Bicycle facilities are recommended as part of the Thoroughfare Plan (see Figure 15), which includes roadway improvements with wide outside lanes, bike lanes, paved shoulders, and multi-use paths.

Aside from these facilities, there are also a variety of off-street bicycling opportunity areas, primarily in the form of greenways. Figure 23 illustrates some of these opportunities. The recommendations that are part of the Thoroughfare Plan are shown in two shades of blue, and potential greenway opportunities are shown in shades of green.

Potential greenway trail opportunities include major stream corridors within the study area, such as Twelve Mile, Six Mile, or even Waxhaw Creeks. Larger streams provide greater regional connectivity, accessing more places and people. They should also pose fewer development conflicts with respect to land use zoning, non-buildable lands and soils, proximity to existing structures, and even cost. Additional potential greenway trail opportunities exist along minor stream corridors to connect residential areas, parks, schools, or additional recreational destinations.

## Major opportunities for bicycle improvements

- Boulevard roadway projects with wide outside lanes
- New Town Road and Crane Road roadway projects with off road multi-use path construction
- Major and minor thoroughfare roadway projects within and near the Village of Marvin
- Major stream corridor areas, such as Twelve Mile Creek and Waxhaw Creek
- Minor stream corridor areas connecting to (a) on-road bike facilities, (b) major stream corridor opportunity areas, or (c) adjacent municipality facilities.

## Constraints

Development of greenway trail facilities can be constrained by numerous factors, including social, environmental, financial, and land use issues. Within the Six Mile Creek and Waxhaw Creek watersheds there is a federally-listed endangered species (Carolina Heelsplitter), which places additional development restrictions within all supporting creeks, streams, tributaries and other riparian areas of the watershed. A development buffer of 100' for all riparian areas, and 200' of riparian areas with an associated 100-year FEMA-designated floodplain has been imposed to protect the water quality and this species. The development of a greenway trail is subject to these development restrictions, however is listed as "potentially allowable" by the NC Department of the

Environment and Natural Resources (DENR) - Division of Water Quality (DWQ) through a permitting process. These water quality protection rules have the effect of decreasing the total amount of developable land surrounding streams, however, they may also increase the potential for greenway trail construction as part of a land conservation and water quality preservation effort.

## Other recommendations

The four member communities may also wish to consider adopting policies that support bicycle travel as noted in the "Ancillary Bicycle Facilities" section. These may include provision of shower and locker facilities in employment centers, better bike parking, and other amenities. These policies can be adopted as part of the Land Use Policies and Ordinances in Section 5.

### 4.5 Pedestrian Recommendations

Creating walkable communities is an important objective of any transportation plan, whether rural, suburban, or urban. Developing comprehensive and connected pedestrian systems can add numerous quality of life benefits to a community, in addition to providing another alternative to trips made by car.

## Major elements of walkable community

## Sidewalks

One measure of a walkable community is the existence of connected sidewalks. Sidewalks are sometimes constructed as required by local development ordinances as lands are subdivided and developed. This can lead to a disconnected pattern of new and old sidewalks throughout an area. Recording, assessing, maintaining, and connecting sidewalks is an important process for filling in "missing links" in the sidewalk system and enhancing pedestrian connectivity.

## Safe intersections

Intersection crossings are common conflict points between pedestrians and vehicles. The Intersection Plan that is part of this study makes recommendations for specific intersection improvements to enhance safety and increase capacity.

## Connected systems

Walkability is also a reflection of the general connectivity between pedestrian systems and facilities. Physical barriers or gaps between constructed pedestrian facilities are major obstacles to the walking. When faced with such obstacles the options are generally to (a) walk in unsafe conditions, such as along roadways, or (b) select an alternative mode of transportation, typically driving. The emphasis should be on connecting pedestrian facilities and allowing them to work as a system rather than individual components.

## Intermodal connectivity

Combining modes of transportation is another measure of walkability. This would include developing locations with considerations for not only vehicles, but also for pedestrians, bicycles, and transit. Some examples would include a development with:

- Vehicular considerations (parking, access, signage, traffic signals, turn lanes)
- Pedestrian considerations (connected sidewalks, direct routing, curb cuts and ramps, signage, lighting)
- Bicycle considerations (bicycle parking, curb cuts and ramps, access paths)
- Transit considerations (pick up/drop off location, signage, shelter, lighting)

The ultimate goal of intermodal connectivity would be a reduction in the number of single-purpose and single-occupant vehicular trips made within a community. The benefits would be reduced traffic congestion along roads, increased safety and efficiency of the entire system, improved air and water quality, and a better quality of life for citizens.

## Recommendations

Recommended pedestrian improvements include:

- Implement sidewalk improvements as part of roadway improvement projects on the Thoroughfare Plan
- Implement intersection improvements as part of Intersection Plan
- Develop a local sidewalk ranking system that identifies needed sidewalk projects and ranks them on a series of measurable criteria. Projects would be built as funding sources become available.

### 4.6 Transit

The LARTP does not include recommendations for new mass transit service into the study area or local transit service within the study area. As the area continues to grow and the roadway system continues to develop, some transit along major corridors may be viable. The Steering Committee agreed that the most effective transit solution may be development of park-and-ride lots in targeted commercial areas within the study area to connect commuters to the Charlotte metro area and its various existing and planned mass transit options. The mechanism for developing these park-andride lots is detailed in Section 5 (Land Use Policies and Ordinances).

## 5 Land Use Connections: Policies and Ordinances

Transportation systems are built to provide opportunities for the movement of people and vehicles from one destination to another. The manner in which land is developed and designed along transportation routes plays a critical role in the effectiveness and efficiency of the transportation system. And the reverse is also true - the design and development of transportation systems affect land use patterns and the quality and character of developed areas and in turn directly affect quality of life.

### 5.1 Considering the Linkage Between Land Use and Transportation Planning

One of the steps in the LARTP planning process has been to assess the linkage between transportation and land use planning in the western Union County study area and to identify ways to better coordinate planning efforts to achieve the desired goals in western Union County: decrease road congestion, provide safer roads and intersections, maintain rural character, provide safe routes for bicyclists, pedestrians, and others.

The ways in which the four towns and the county develop their land directly impacts the local transportation network, including roadways and alternative modes such as transit, cycling, and walking. For example, development along NC 16/Providence Road, when combined with the high volume of through trips, has led to a decrease in the level of service along this corridor, particularly creating congestion during peak commuting hours. The land use plans of the four participating municipalities have played and will continue to play a critical role in determining the future transportation needs within the LARTP study area. These land use plans are discussed in this chapter.

This chapter also provides a look outside of the study area to other North Carolina communities that have experienced similar growth and transportation issues. In particular, the transportation and land use planning efforts in Matthews, Huntersville, Cary and Charlotte, North Carolina, were reviewed to learn about the planning strategies in place in these communities and the lessons they have learned from implementation.

Considering the current and future conditions of the LARTP planning area, the lessons learned from similarly situated North Carolina communities, and the implementation tools feasible for
implementing this planning effort, this chapter goes on to provide recommendations for ordinance amendments for the four LARTP jurisdictions. This includes model ordinance language provided in the appendix to this plan. For consistency of planning and implementation in this local area, it is recommended that these standards should be as consistent as possible throughout the planning area.

### 5.2 Land Use Planning in the Study Area

Union County has been one of the fastest growing counties in the state and the nation over the last decade. And much of that growth has taken place within this study area. The table below shows available population estimates for 1990, 2000, and 2007 for the four participating LARTP municipalities and Union County as a whole. Each municipality has seen steady population growth since 1990.

Table 7: Population Growth

|  | 1990 | 2000 | $1990-2000$ <br> $\%$ Change | $2007 * *$ | $2000-2007$ <br> $\%$ Change |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Marvin* | -- | 1,039 | -- | - | -- |
| Waxhaw | 1,294 | 2,625 | $103 \%$ | -- | - |
| Weddington | 3,803 | 6,696 | $76 \%$ | - | - |
| Wesley <br> Chapel* | - | 2,549 | - | - | -- |
| Union County | 84,210 | 123,677 | $47 \%$ | 182,344 | $47 \%$ |

Source: U.S. Census Bureau (1990, 2000); North Carolina State Office of Budget and Management (2007)
*Note that the Villages of Marvin and Wesley Chapel incorporated after the 1990 census and therefore do not have population estimates for that year.
**Accurate population estimates for 2007 for these municipalities are not currently available. The upcoming census will establish more accurate population figures for tracking growth.

Growth has slowed in recent years due to infrastructure constraints in Union County and the national economic downturn, but is expected to continue into the future. As illustrated in figures 10 and 11 shown previously, population growth is expected to occur throughout the study area with a focus along the NC-16 corridor in the Town of Waxhaw, north of Waxhaw Marvin Road near the state border, and south of Old Waxhaw Monroe Road at the southeast corner of the study area. Employment is expected to be focused along NC-16 within Waxhaw, along with a small pocket of employment along NC-84 between Twelve Mile Creek and Deal Roads.

To prepare for future growth, all four communities have prepared plans to establish community visions, set goals for guiding new development, address needs for new infrastructure, and improve the character and quality of life in each respective community.

- The Town of Weddington adopted its Land Use Plan in 2002. The plan articulates the varied interests within the community and sets out a series of community goals, including planning for new low-density single-family residences and subdivisions, protecting open spaces and rural character within the community, and coordinating with neighboring jurisdictions on future infrastructure needs.
- The Village of Marvin adopted its Land Use Plan in 2004. Goals of the plan include maintaining its small town character and low-density land use pattern, preserving open spaces, providing new opportunities for recreation, and planning for community-oriented commercial developments to serve Village residents. The plan calls for the future Village Center to be
located in the vicinity of the existing Town Hall on New Town Road between Marvin Road and Marvin School Road.
- Wesley Chapel adopted its 2030 Vision Master Plan in 2008. The goals of the plan focus on protecting rural character, focusing more intense development with new housing options around a new Village Center to serve as the "heart of the community", and maintaining the rural character in the outer areas of the community through lower density subdivision designs.
- The Town of Waxhaw adopted its 2030 Comprehensive Plan in 2009. The plan sets a course for creating a more compact development form, increasing housing choices, coordinating the provision of new infrastructure with new development and population growth, increasing transportation options (bicycle, pedestrian, and transit), focusing commercial development within the heart of the community (downtown), improving community access to parks, greenways, and open spaces, and participating in regional coordination for infrastructure.
- Union County is also preparing a Comprehensive Plan. This plan acknowledges and plans for development around the municipalities and along major transportation corridors, such as Highway 74 and the future Highway 74 Bypass, and seeks to protect rural and lower density residential areas in the remainder of the county.

As map on the next page illustrates, the future land use plans for the four towns and Union County set out a course for a predominantly low-density residential land use pattern surrounding small town centers within the study area. The majority of the denser development is likely to occur in and around the Town of Waxhaw where more dense development patterns already exist and where the new Waxhaw Comprehensive Plan encourages new development.

### 5.3 Community Case Studies

There are communities in North Carolina that have experienced similar growth pressures and land use/transportation planning needs as western Union County. The Steering Committee for the LARTP selected three high growth municipalities that have undertaken proactive planning approaches in the last decade (Cary, Huntersville, and Matthews, North Carolina) and one model road corridor (Ardrey Kell Road in Charlotte, North Carolina) to investigate and ask the following four questions:

- How have these communities managed impending growth?
- How do they plan for and fund infrastructure needs?
- How do they address the land use / transportation nexus?
- Have they been successful at accommodating growth and maintaining community character?

These case studies take a look at high-growth communities that are working to preserve their historic small town and rural character while accommodating new development and necessary transportation infrastructure improvements. Plans and ordinances from these communities were reviewed and planners from each community were interviewed. A summary of these findings is provided here and the full case study report is found in the appendix.

- Planning Coordination with Neighboring Jurisdictions. Each community interviewed worked closely with neighboring jurisdictions to coordinate land use planning, adopt

annexation agreements, and develop infrastructure improvement plans. This was a common theme across these communities and a necessity for planning success.
- Implementing Plans into Ordinances. The Town of Huntersville has developed twelve small area plans focused around key corridor areas. These small area plans are drafted in such a manner that they can be directly implemented into the local zoning ordinance following adoption of the plan. The Town of Cary has also implemented key land use policies by revising residential zoning in rural areas to ensure rural character through density and design provisions. The Town of Matthews has the authority from the North Carolina General Assembly to use conditional zoning. This tool allows the local government and planners to uphold local land use policies by working with developers to develop solutions to site specific issues that may not be addressed directly in the zoning and subdivision ordinances.
- Focus Land Use Planning Along Key Corridors. One way to ensure the coordination of transportation and land use planning is to focus planning efforts along key corridors. Matthews has developed a highway overlay zone for NC-51 to establish consistent access management, streetscape, landscaping, land use, and parking standards along this developing corridor. Huntersville uses the small area planning process and focuses on key growth corridors.
- Use of Official Maps. All three communities ensure the coordination of their transportation plans and land use plans through official maps, including official zoning and thoroughfare maps. Matthews actually depicts thoroughfare plans on its official zoning map to reinforce the connections.
- The Importance of Connectivity. These communities stressed the importance of creating connected communities. Matthews is currently working through its Downtown Master Planning effort to retroactively create more connectivity in downtown by developing new intersections and connecting roads. Huntersville uses traditional town planning principles that organize centers of development around existing and planned road and transit infrastructure, ensuring internal and external connectivity to activity centers and residential areas.
- Commitment to Planning. Given the growth challenges facing each of these communities, a commitment to planning is critical to achieving success. Huntersville hired a transportation planner and a liaison planner that works across the land use and transportation departments to ensure consistency of planning efforts. The Town creates an annual list of priority transportation improvement projects, including sidewalks and bikeways, and uses local general funds and bonds to fund projects. Cary and Matthews have also used general funds and bonds to fund local transportation projects and to provide bridge funding to the North Carolina Department of Transportation for state initiated projects needing funding assistance.
- Private Investments in Transportation Infrastructure. Huntersville has adopted a Transportation Impact Assessment ordinance that establishes transportation level of service standards and a process for developments meeting a certain threshold to assess impacts on the transportation system and mitigate those impacts through infrastructure improvements or others means. The town designed the Ordinance to not only ensure that transportation impacts were addressed before developments were completed, but also uses it as a tool to guide
development to targeted areas. Cary has adopted an Adequate Public Facilities Ordinance that requires that adequate public transportation facilities are in place to service a new development before it is constructed. The town also uses developer impact fees to pay for development of new water/sewer and transportation infrastructure.
- Standards for Design. Huntersville has adopted design guidelines that interpret plans and guide developers in designing for street connectivity, streetscape improvements, building and parking placement and orientation, and other design factors. Cary's zoning ordinance includes standards for rural collectors and rural thoroughfares to ensure that roads in rural areas are more in keeping with the agricultural and rural context. The Ardrey Kell Road in Charlotte was designed to provide "complete streets" within a rural and suburban development context, including sidewalks, wide development setbacks in rural areas, build-to lines in more densely developed areas, and internally accessed commercial sites to ensure road capacity through managed access.

There is much to learn from communities that have been through similar growth periods. These ideas, combined with examination of the current policy and regulatory framework in Western Union County, can help create a foundation for coordinated land use planning.

### 5.4 Ordinance Review

Land use ordinances are one of the most powerful tools that local governments have to shape future growth and development within their community. These zoning and subdivision ordinances provide specific standards for new development and redevelopment, and typically guide the amount of land that can be developed on a site, uses for the site, required site improvements, and design features.

Marvin, Weddington, and Wesley Chapel each have individual sets of zoning and subdivision regulations. Waxhaw combines them into a unified development ordinance. Each community individually uses these ordinances to guide development. These four sets of regulations share some commonalities, but are generally lacking in consistency in terms of the types of standards and specific requirements. Key recommendations for implementation of the LARTP are to improve land use regulations within the key transportation corridors that serve and connect the municipalities, and to achieve more consistency in regulations among the jurisdictions for the rules that apply to each of these corridors.

Following are descriptions of the transportation related land use regulations that are currently in place for the four participating western Union County municipalities. Table 8 at the end of this section summarizes these ordinance provisions.

Marvin
The Village of Marvin has provisions in its Zoning and Subdivision Ordinances relevant to the LARTP as follows:

- Access Management: Standards for street development are addressed, but do not include access management standards. Provisions include coordination with existing streets, and for large track subdivisions the alignment of streets, and street access. (See Article IV, Section 7 of the Subdivision Ordinance.)
- Improvements and Right-of-Way Dedications: Arterial, major and minor collectors, and local streets are to be reserved in compliance with official street plans. Standard regulations for local streets required as part of subdivision also addressed. (See Article IV of the Subdivision Ordinance.)
- Cul-de-sacs: Standards for development of cul-de-sacs, including maximum abutting lots and minimum radii are addressed, but do not include standards for limiting use of cul-de-sacs or requiring connectivity within subdivisions. (See Article IV, Section 3 of the Subdivision Ordinance.)
- Tree Protection: An independent Tree Protection Ordinance addresses exterior perimeter and interior planting requirements, street tree requirements, parking lot tree requirements, permit requirements for removal of trees, identification of existing trees as part of permit applications, replacement requirements for removed trees, and protection of root zones during construction. (See Tree Protection Ordinance.)
- Streetscape Improvements: Sidewalks, pedestrian crosswalks, and green strips (i.e., sidewalk yards) are required of major subdivisions. (See Article V, Section 9 of the Subdivision Ordinance.)
- Landscaping and Buffers: Screening and landscaping provisions are provided. Planting strips are required for office and business zoned that abut major or minor thoroughfares and are to be adjacent to the street right-of-way. (See Section 4.2 of the Zoning Ordinance.)
- Existing Corridor Overlay Zoning Districts: A Commercial Corridor District addresses retail and office developments in designated areas along Rea Road and NC 16. (See Section 5.6 of the Zoning Ordinance.)

Waxhaw
The Town of Waxhaw has provisions in its Unified Development Ordinance relevant to the LARTP as follows:

- Access Management: Street provisions include coordination of streets and greenways, access to adjacent properties, and street intersections, and points of ingress and egress. Access management standards are not included. (See Section 18.9.2 and Section 18.9.7.)
- Improvements and Right-of-Way Dedications: Development and conveyance of local streets and public right-of-way are required. (See Section 18-10-1.)
- Requirements for Street Stub-outs: When deemed relevant by the Town Administrator, Planning Board, or Board of Commissioners, street stub-outs may be required during as part of the subdivision process. (See Section 18.9.2.1.)
- Requirements for Cul-de-Sacs: Standards for development of cul-de-sacs, including maximum length and minimum radii are addressed, but do not include standards for limiting use of cul-de-sacs or requiring connectivity within subdivisions. (See Section 18.9.2.12.)
- Tree Protection: Tree preservation provisions include requirements for permits prior to removing trees, along with criteria for determining whether or not a permit for removal may be granted. There are special protections for designated canopy, understory, and Heritage trees, and provisions for protection of trees during construction and requirement of street trees in subdivisions. (See Section 9.21.)
- Streetscape Improvements: Sidewalks are required in all zoning districts. Streetscapes for nonresidential and multi-family buildings are regulated by standards included in the newly adopted Architectural Design Standards. (See Section 18.91.6 and Section 9.23(V).)
- Landscaping and Buffers Along Roadways: Landscape Plans are required for each site plan and screening/buffering requirements are provided between certain zoning districts and along the perimeters of certain lots for office/industrial/commercial uses. These requirements are not necessarily required to provide landscaping along public roadways. (See Section 9.8.)
- Existing Corridor Overlay Zoning Districts: A Thoroughfare Protection Overlay District addresses lot width, parking, and front building setbacks (Section 6.4 of the Waxhaw Zoning Ordinance).

## Weddington

The Town of Weddington has provisions relevant to the LARTP in its Zoning and Subdivision Ordinances as follows:

- Access Management: Basic standards for streets developed as part of a subdivision are provided, but do not include access management standards such as minimum distances between driveways. (See Section 46.76.)
- Improvements and Right-of-Way Dedications: Public right-of-ways for major and minor thoroughfares shown on the MUMPO Thoroughfare Plan as adopted by the Town of Weddington must be reserved by the property owner. (See Section 46-76(j)(6).)
- Requirements for Street Stub-outs: When deemed relevant by the Town Council, street stubouts may be required during as part of the subdivision process. (See Section 46-76(e).)
- Requirements for Cul-de-Sacs: Standards for development of cul-de-sacs, including maximum length and minimum radii are addressed, but do not include standards for limiting use of cul-de-sacs or requiring connectivity within subdivisions. (See Section 46-76(g).)
- Tree Protection: Trees are required as part of the thoroughfare buffering requirement. (See Section 46-76(d).)
- Landscaping and Buffers: Vegetated buffers are required alongside and rear lot lines abutting major and minor thoroughfares and specific standards set out how this is can be accomplished. (See Section 46-76(d).)

## Wesley Chapel

The Village of Wesley Chapel has provisions relevant to the LARTP in its Zoning and Subdivision Ordinances as follows:

- Access Management: Basic standards for streets developed as part of a subdivision are provided, but do not include access management standards such as minimum distances between driveways. (See Section 405.10.)
- Improvements and Right-of-Way Dedications: Public right-of-ways for major and minor thoroughfares shown on the Union County Thoroughfare Plan as adopted by the Village of Wesley Chapel must be reserved by the property owner. (See Section 405.10.)
- Requirements for Street Stub-outs: When deemed relevant by the Village Council, street stubouts may be required during as part of the subdivision process. (See Section 405.10.)
- Requirements for Cul-de-Sacs: Standards for development of cul-de-sacs, including maximum length and minimum radii are addressed, but do not include standards for limiting use of cul-de-sacs or requiring connectivity within subdivisions. (See Section 405.7.)
- Tree Protection: Retention of existing vegetation is encouraged during the subdivision process. The incorporation of mature trees in buffer zones may be considered favorably in the event of a waiver for thoroughfare buffering requirements. (See Section 404.)
- Streetscape Improvements: Sidewalks are required as part of the subdivision process and bicycle improvements are encouraged. (See Section 405.8.)
- Landscaping and Buffers: Vegetated buffers are required alongside and rear lot lines abutting major and minor thoroughfares. (See Section 405.4.)

Table 8: Ordinance Provisions by Municipality

| Ordinance Provisions | LARTP Communities |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Marvin | Waxhaw | Weddington | Wesley Chapel |
| Access Management | Basic street standards no requirements for minimum distance between driveways | Basic street standards no requirements for minimum distance between driveways | Basic street standards no requirements for minimum distance between driveways | Basic street standards no requirements for minimum distance between driveways |
| Transportation Impact Assessments | -- | -- | - | - |
| Right-of-Way (ROW) Dedication | Required for thoroughfares and local streets on official street plans | Required for thoroughfares and local streets on official street plans | Required for major and minor thoroughfares on MUMPO Thoroughfare Plan and local streets | Required for major and minor thoroughfares on Union County Thoroughfare Plan and local streets |
| Internal Access <br> Requirements for Commercial Developments | - | - | - | - |
| Requirements for Street Stub-outs | -- | Can be required by Administrator, Planning Board, or BOC Action | Can be required by Council Action | Can be required by Council Action |
| Requirements for Cul-desacs | Basic standards for design - no limitations on use | Basic standards for design <br> - no limitations on use | Basic standards for design <br> - no limitations on use | Basic standards for design <br> - no limitations on use |
| Tree Protection | Tree Protection Ordinance | Tree Preservation Standards and Permit Requirements | Required as part of buffering requirements | Encourage retention of existing vegetation; trees required in buffer areas |
| Streetscape Improvements | Sidewalks, crosswalks, planting strips required for major subdivisions | Sidewalks required in all districts and sidewalks and planting strips provided in all subdivisions; design guidelines for multi-family and non-residential | - | Sidewalks required in subdivisions; bicycle improvements encouraged |
| Landscaping and Buffers along Roadways | Office and Business Zones require planting strips along ROW | Landscape Plans with each Site Plan | Buffers along thoroughfares required | Buffers along thoroughfares required for subdivisions |
| Corridor Overlay Districts | CCD District addresses Retail/Office Development along Rea Rd/NC 16 | Thoroughfare Protection Overlay District addresses design standards along NC 16 | -- | - |

### 5.5 Policy Recommendations

Based on the lessons learned from other communities, including the case studies described above, and review of best planning practices for rural high growth communities, a list of land use planning principles and policy recommendations follows.

The following principles are suggested here as key components of a transportation strategy for this study area. Policy recommendations are offered for consideration under each principle.

- Retain the rural and small town character of towns and villages through managed development. The municipalities should continue to undertake managed development approaches that allow the village/town to provide for expected new growth and development over the next 20 years while maintaining the rural nature and character of western Union County. Non-residential developments should be located and designed in a manner that upholds the rural character of the area.
- Ensure that public infrastructure improvements (such as transportation improvements and extension of water and sewer services) are consistent with future land use plans. Development of new roads and sewer infrastructure can be a trigger for additional growth and development. Adoption of Capital Improvement Plans that take a long-term approach to capital improvements at the local level and agreements with Union County regarding the extension of public services are two tools that can help ensure coordination of public improvements with local land use goals and policies.
- Guide development of new commercial and employment centers to locations that can maximize the existing roadway capacity, provide better accessibility to services and goods to local residents, encourage alternative transportation (pedestrian, bicycle, and future bus/transit) access to the development, and maintain the rural character of western Union County. A common pattern in the LARTP study area is to develop commercial businesses and retail centers along the major transportation corridors, particularly along NC-16. Traffic congestion is a daily occurrence because this road is used both for regional commuting into Charlotte as well as for local trips to commercial centers. Providing retail opportunities in specific centers, such as the planned Wesley Chapel Village Center can alleviate traffic demand on NC 16 and other roads while also creating better accessibility to goods and services for residents. Commercial and employment centers should be designed at a scale that is in keeping with the character of the municipality and, to the extent possible, should be designed to encourage use of any future bus/transit service that may be provided within the study area in the future.
- Encourage development of master planned commercial/employment centers. Centers should be designed as "campuses" that integrate the development of multiple uses and structures into a cohesive framework, provide for multi-modal access to centers and between uses within centers, manage access to and from adjoining thoroughfares, and provide buffers between adjacent uses.
- Provide pedestrian and bicycle accessibility within and between adjoining neighborhoods. Residents of western Union County have expressed interest in having additional opportunities for walking, biking, and general recreation in close proximity to their homes. New
developments should be designed to provide internal accessibility for multiple modes of transportation throughout the development, and particularly to points of interests, such as parks and schools.
- Protect rural open spaces. Protecting undeveloped farmlands and open spaces through private conservation easements or public acquisition of lands are two tools for ensuring that rural character is truly protected in western Union County.

These should be considered by all four municipalities and Union County when updating land use and comprehensive plans in the LARTP study area.

### 5.6 Ordinance Recommendations

In addition to adoption of policies and land use plans to guide decision-making and influence the form of new development and redevelopment within the study area, some of the land use transportation objectives of this initiative can be accomplished through regulatory requirements. Following is a table that summarizes potential ordinance provisions and model ordinances recommended for consideration.

Table 9: Recommended Ordinance Provisions

| Ordinance Provision | Summary Description |
| :--- | :--- | \left\lvert\, \(\left.\begin{array}{l}Define characteristics of various classifications of roadways, such as <br>

arterial, collector, and local streets, mirroring the classification system in the <br>
LARTP.\end{array}\right.\right\}\)

| 6. Access Management, Driveway Spacing and <br> Non-Residential Connectivity | Addresses access management, driveway spacing, and connectivity <br> requirements. |
| :--- | :--- |
| 7. Bicycle and Parking Amenities | Require bike racks to serve bicycle commuters for developments of a <br> certain threshold and encourages development of additional bicycle <br> facilities, such as on-site shower facilities. |
| 8. Parking Fund Payments-in-Lieu | This provision includes an option for new developments to substitute <br> payments into a parking fund for provision of some or all required off-street <br> parking, with funds to be used to help fund improvements such as park-and- <br> ride lots. These types of provisions are often used in downtowns and town <br> center areas. |
| 9. Transit-Oriented Development Standards | Model ordinances to provide examples for implementation of transit- <br> oriented development districts and standards, such as minimum densities, <br> transit-friendly building design/orientation, and walkways/bikeways in <br> designated transit-oriented locations. |
| 10. Transportation Management Plan <br> Requirements | Model ordinance requires all non-residential developments to provide <br> employer-sponsored and managed Transportation Management Plans <br> (TMP), to encourage employees and patrons to walk, bike, and take transit <br> instead of relying on automobiles for mobility. Similar provisions could also <br> be adopted to specify a threshold (e.g., developments that will employ 100 <br> or more employees) that would trigger requirements for TMPs. |

Sample ordinance language for each of these suggested provisions is included in Appendix C. Achieving consistency among the jurisdictions for regulatory treatment of land use and roadway corridors that traverse multiple communities is most important in the following areas:

- Definitions of roads
- Cross-section and ROW requirements
- Traffic Impact Analysis required information
- Access management provisions

Each of the four communities needs to determine which of these provisions is acceptable to include in the regulatory array for that community.

# 6 Implementation Plan: How We're Going To Get There 

### 6.1 The Key: Implementation

One of the primary purposes of developing the LARTP was to give the four member communities the information, data, and plans to effectively solve today's problems and plan for tomorrow's. The recommendations in the previous section go a long way toward accomplishing this end. But those recommendations would be relatively worthless without an effective tool to implement them. The Implementation Plan in this section creates a unified and comprehensive approach to working on these problems both as a group of communities with common issues and as local communities planning for local needs.

### 6.2 Funding

The LARTP is a long-range plan with a variety of projects which will be implemented over time through use of various funding options. While some of the large-scale projects will be constructed with federal and state funds distributed through the regional planning process, others will be built with local funds and through cooperation with the development community.

- Transportation Improvement Program (TIP): The state's Transportation Improvement Program supports local and regionally significant transportation projects through funding sources that include Federal Aid Construction Funds and State Construction Funds.
- Transportation Bonds: Transportation bonds are a traditional funding mechanism for local communities throughout North Carolina. Voters in communities of all sizes vote to improve their transportation system through self-assessment.
- NCDOT Division Funds: Each of the NCDOT division offices has discretionary funds to make transportation improvements for small-scale projects. Each of the four LARTP member communities has taken advantage of these funds, which are good sources of funding for projects like intersection improvements and access management projects.
- Developer Contributions: It is common for the development community to make contributions or construct improvements as part of the development approval process. While developers
of new projects are typically not responsible for fixing existing deficiencies, they can help mitigate the potential impacts on the transportation system by their development.
- State Street-Aid (Powell Bill) Funds: Annually, state street-aid (Powell Bill) allocations are made to eligible and qualified incorporated municipalities. Powell Bill funds are used only for maintaining, repairing, constructing, reconstructing or widening of local streets that are the responsibility of the municipalities, or for planning, construction, and maintenance of bikeways or sidewalks along public streets and highways.
- Enhancement Grants and Congestion Management and Air Quality (CMAQ) Funds: These two funding sources are applicable to a variety of project types, but can be especially beneficial when applied to bicycle and pedestrian projects, greenway development, and beautification and streetscape enhancement projects.
- Other Funding Sources: These may include federal stimulus funds (may not be available in the long-term), impact fees (not currently widely used in North Carolina), and funds from nonprofit or private organizations (such as Active Living By Design) intended to support planning and development of non-vehicular transportation systems. Other sources also include county-wide sales taxes, land transfer taxes, and targeted programs such as Safe Routes to School.

### 6.3 Implementation Plan

## Implementation Plan - Improvements

The Implementation Plan on the following pages is the blueprint for making the various recommended improvements detailed in the LARTP. As shown in the Implementation Plan, some projects will require coordination among jurisdictions as well as coordination with regional transportation planning partners. Others are projects that will likely be part of future development proposals. And still others are projects that will be locally-determined and developed. The implementation plan for roadway projects is detailed in Table 10 and for intersections in Table 11.

## Implementation Plan - Policies and Regulations

Section 5 identifies policy and ordinance changes that would promote mobility within this study area through land use policies and regulations. In addition to pursuing funding for roadway and intersection improvements as recommended above, the four participating municipalities should consider two additional areas for action:

- Policy Statements: The municipalities should consider adopting policies to serve as guides to decision-making. One good way to do that would be to select policies from those offered in Section 5 and incorporate those into local municipal land use plans via amendment of those plans.
- Ordinance Amendments: Section 5 offers a series of regulatory approaches to land use management that could be incorporated into local municipal zoning and subdivision ordinances. Appendix 3 offers specific model language that could be built into local ordinances.

Table 10: Implementation Plan - Recommended Roadway Projects

| Map ID | Facility and Section | From | To | Description | Recommended ROW (ft) | Recommended Cross-Section | Affected Municipality ${ }^{1}$ |  |  |  | Potential Funding <br> Source ${ }^{2}$ <br> Comments |  |

| H72 | Cox Rd (SR 1343) | Weddington MatthewsRd (SR 1344 ) | NC 84 (Weddington Rd) | Upgrade to standard 2-lanes w/ shoulders | 34 | D |  |  | ** |  | local bond; developer |  |
| H73 | Weddington Town Center Northern Access Road (new) | NC 16 (Providence Rd), north of NC 84 | Weddington Mattews Rd (SR 1344) | Construct 2-Iane facility | 34 | D |  |  | ** |  | local bond; developer | Conceptual alignment only; to be further defined as part of Weddington Town Center Master Plan process |

1. Mar = Marvin; Wax = Waxhaw; Wed = Weddington; WCh = Wesley Chapel; ** = Primary jurisdiction affected by improvements; * = Secondary jurisdiction affected by improvements
2. Since many projects cross multiple jurisdictions and may involve multiple funding sources, cooperation among municipalities, Union County, and the NCDOT will be critical. This is especially important as the recommended cross-sections are applied in
different jurisdictions within the same project. To the extent feasible, similar cross-sections, treatments, and other roadway and intersection facilities should be standardized within project limits.
3. Projects are not ranked within priority levels.

Table 11: Implementation Plan - Recommended Intersection Projects

| ID | Intersection | Description | Affected Municipality ${ }^{\text {a }}$ |  |  |  | Potential Funding Source | Comments |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| High Priority Projects |  |  | Mar | Wax | Wed | WCh |  |  |
| x2 | Weddington-Matthews Road @ Hemby Road | \|mprove intersection (turn lanes, signalization/timing, channelization, etc - as warranted); consider installing roundabout |  |  | * |  | Multiple sources (NCDOT Division funds; bonds; developer contributions; CMAQ; Enhancement Grants |  |
| X4 | Weddington Road @ Weddington Matthews Road \& @ Providence Road; Providence Road @ Weddington School Road | Improve intersections \& coordinate operations; manage access \& permitted movements; re-align/consolidate if feasible |  |  | * |  |  | Component of potential Town Center |

## Appendix C: Possible Ordinance Provisions, Draft Sample Language, and Model Ordinances Related to Transportation Management

#### Abstract

The following possible ordinance provisions are intended to serve as a menu of options from which the LARTP communities can choose from in updating their ordinances as part of the LARTP implementation. While the four communities share many community character traits, each community has a unique development context and may require tailored solutions. The options provided in this appendix are intended to serve as a starting point for updating local ordinances. Model ordinance language provided here will need to be revised to fit the specific context of individual ordinances and development contexts.

The information provided in this appendix comes in two forms: draft model ordinance language and example model ordinances. For those provisions which are likely to be dealt with in a similar way among the four communities, model ordinance language has been provided in the first section. The second section addresses development issues that will likely require language crafted for each specific community context. For these issues, examples of model ordinances that have been adopted in other communities are provided and serve as a starting point for updating the development ordinances of the LARTP communities.

## MODEL ORDINANCE PROVISIONS

## 1. Definitions of Roads

This provision defines characteristics of various classifications of roadways, such as major and minor thoroughfares, collectors, and local streets, mirroring the classification system in the LARTP. A description of the intent of the roadway classifications, including the character and nature of the road types, should be included in this ordinance provision.

## Sample Language

The characteristics, cross-sections, definitions, and classifications of roadways shall be as designated in the Local Area Regional Transportation Plan, as adopted by the municipality.

In addition, local ordinances can include the specific definitions of these road classifications within the "Definitions" section of the development ordinance.

## 2. Transportation Purpose Statement

This provision states the reason, intent, and justification for regulations that are to follow.

## Sample Language

In accordance with the Local Area Regional Transportation Plan developed in collaboration with and adopted by the Village of Marvin, the Town of Waxhaw, the Town of Weddington, and the Village of Wesley Chapel on <date>, the provisions of this section are intended to ensure: (a) an integrated system of roads that provides safe and efficient traffic circulation; (b) the efficient movement of through traffic by providing an interconnected system of roads; (c) uncomplicated road layouts so that emergency service personnel, public service personnel and visitors can find their way to and from destinations; and (d) controlled access to thoroughfares.

## 3. Right-of-Way Dedication Provisions

This provision requires dedication of public right-of-way, either new or expanded, for all new residential and non-residential development, as called for in LARTP cross-sections.

## Sample Language

Where a proposed development application includes any part of a street or thoroughfare, or includes frontage on a designated street or thoroughfare as indicated on Figure 15: Highway Map of the Local Area Regional Transportation Plan, right-of-way shall be dedicated in the location and configuration shown and described for that classification of roadway in Figures 21 and 21b of the Local Area Regional Transportation Plan. This
right-of-way area shall be as measured from the centerline of the existing or proposed street or thoroughfare. Any yard setbacks applicable to the development shall be measured from the boundary line that divides the parcel and the dedicated right-of-way.

## 4. Transportation Impact Analysis (Threshold, Process, Information Requirements)

This provision requires development of a Transportation Impact Analysis (TIA) for subdivisions and all other development proposals for which 100 peak hour trips are generated by the proposed development. The municipality has options for the TIA procedures: (1) the applicant prepares the TIA and submits the TIA with the development application and (if necessary) pays a fee to the municipality for review of the TIA, or (2) the municipality estimates the cost to develop and review the TIA for a particular application, the applicant pays the TIA fee, and municipality arranges for preparation and review. TIAs should project additions to average daily trips and peak hour trips, estimate current and projected levels of service (LOS), include roadway improvement and right-of-way dedication needs that comply with cross-sections in the LARTP, and consider non-automobile modes, including bicycle, pedestrian, and transit needs.

## Sample Language

## (A) Applicability

(1) TIA Required for Development Generating Over One Hundred Peak Hour Trips

A Traffic Impact Analysis (TIA) shall be required for any proposed development or multiple phases of development (i.e., contiguous tracts under the same ownership) anticipated to generate more than one hundred (100) peak hour directional trips. Peak hour trips shall be measured as defined in the most recent edition of the Institute of Transportation Engineer's Trip Generation Manual.
(2) Redevelopment

In the case of redevelopment, trip generation will be defined as the number of net new trips generated by the proposed use beyond the trips generated by the previous use.

## (3) Exemptions

For projects that are not estimated to generate more than one hundred (100) peak hour directional trips, TIA requirements can be waived upon providing a brief technical memorandum to the municipality describing the reasons why the TIA should not be required, including projections of peak hour trips, street capacity issues (LOS), and other issues relevant to the exemption.
(B) TIA Submission for Projects with Cumulative Impacts

A TIA shall be required for development projects that do not otherwise meet the thresholds for submission of a TIA if the application is for a project that:

## (1) Shares Features with Other Developments

Shares features such as site access, common ownership, or other infrastructure with nearby undeveloped property for which future development can be reasonably anticipated;
(2) Can be Expected to Exceed Threshold

When complete, the cumulative impact of the overall development can be expected to exceed the threshold for preparation of a TIA; and
(3) Localized Safety or Capacity Conditions

A TIA may also be required for projects with at least one of the following characteristics:
(a) The project is located in the vicinity of a high accident location per Figures 7 and 8 in the adopted Local Area Regional Transportation Plan;
(b) The project abuts a major thoroughfare;
(c) The project includes highway improvements that are in the Transportation Improvement Program; or
(d) When involvement with an active roadway construction project is necessary.

## (C) Procedure

(1) The TIA shall be submitted along with applications for a Preliminary Plat for Subdivision, Major Site Plan, Planned Development, Rezoning, and Conditional Use Permit. [Alternate: The municipality shall prepare or have prepared a written Traffic Impact Analysis for applicable projects, with cost of preparation of analysis and/or review of the TIA made a component of the development application fee.]
(2) The applicant shall be required to participate in a pre-submittal conference with the municipality and the engineering firm preparing the TIA to establish the study area, trip distribution, traffic counts, approved developments in the area, pass-by and internal capture percentages, and any other questions specific to the TIA. The municipality may choose to not accept TIAs prepared without a pre-submittal conference.
(3) The TIA shall, at a minimum:
(a) Estimate the Traffic Generated

Estimate the peak hour traffic that will be generated as a result of the proposed development. Trips should be estimated for all uses located within the development using the standard Institute of Transportation Engineer's Trip Generation Manual, including pass-by trips, internal trip assumptions, and trip distribution assumptions;
(b) Evaluate Site Access

Evaluate site access, sight distance, and internal circulation;
(c) Evaluate Existing Capacity

Evaluate the ability of the street network to support the proposed development;

## (d) Identify Specific Improvements

Identify specific improvements to the street network that are necessary in order to support the traffic anticipated to be generated by the proposed development and any adjacent areas being analyzed, such as intersection improvements, signalization, turning lanes, etc.;

## (e) Identify Non-Automobile Modes

Identify specific improvements or facilities provided for bicyclists and pedestrians to support non-vehicular access and access to and within the proposed project; and

## (f) Recommendations for Improvements

Include recommendations for site access and transportation improvements or mitigation measures needed to maintain traffic flow to, from, within, and adjacent to the proposed development at an acceptable and safe level of service. Any recommendations for roadway improvements should identify
potential funding sources for improvements and relevant public right-of-way dedications.

Provided in the table below are examples of the Transportation Impact Analysis threshold requirements adopted by North Carolina communities. This list provides examples from communities of a similar nature or population to those in western Union County and does not include all communities in North Carolina that have adopted TIA ordinance provisions.

Table C-1: Examples of TIA Thresholds Adopted by North Carolina Communities

| Jurisdiction | Peak Trips | Daily <br> Trips | Other |
| :--- | :--- | :--- | :--- |
| City of Hendersonville | 100 | 1000 |  |
| Town of Apex | 100 | 1000 |  |
| Town of Indian Trail | 200 | 2000 |  |
| Town of Knightdale | 150 |  | Residential: 50 or more dwelling units <br> Non-residential: covering more than 2 acres, or <br> including more than three building lots, or providing <br> an assembly area for more than 400 persons, or <br> involving office or sales floor area over 20,000 square <br> feet, or within 150 lineal feet of any intersection of <br> two designated thoroughfares, or within 500 lineal <br> feet of any public road intersection currently operating <br> as a level of service D or E, or involving service or <br> delivery vehicles in excess of 1 ton |
| Town of Matthews |  |  |  |
| Town of Mooresville | 100 | 500 |  |
| Town of Shallote |  | 800 |  |

## 5. Incorporation/Reference of Street Cross-Sections in Ordinance

This provision incorporates the cross sections from the LARTP for various street types, including public right-ofway, number of lanes, lane width, planting requirements, sidewalks, etc.) within the ordinance. This provision can also be implemented by reference to the LARTP cross-sections.

## Sample Language

Proposed developments adjoining an area within which Figure 15: Highway Map, in the adopted Local Area Regional Transportation Plan (hereinafter referred to as "LARTP") recommends improvements to an existing road or development of a new street are required to reserve public right-of-way consistent with the detailed cross-sections for the subject street type per Figures 21 and 21b in the LARTP and may be required to make improvements, if deemed appropriate.

## 6. Access Management, Driveway Spacing and Non-Residential Development Connectivity

This provision addresses access management, driveway spacing, and connectivity requirements.

## Sample Language

## (A) Driveway Spacing and Access Management Standards

Driveway spacing and access management standards shall be required for developments adjoining major and minor thoroughfares and shall be consistent with the North Carolina Department of Transportation's Policy on Street and Driveway Access to North Carolina

Highways, July 2003. [The municipality is not limited by the Policy on Street and Driveway Access to North Carolina Highways and may choose to exceed these standards.]

## (B) External Street Connectivity

(1) The arrangement of streets in a development shall provide for the alignment and continuation of existing or proposed streets into adjoining lands in those cases in which the adjoining lands are undeveloped and could possibly be developed in the future or in which the adjoining lands are developed and include opportunities for such connections.
(2) Street rights-of-way shall be extended to or along adjoining property boundaries such that a roadway connection or street stub shall be provided for development at least every one thousand-five hundred $(1,500)$ feet for each direction (north, south, east, and west) in which development abuts undeveloped lands.
(3) At all locations where streets terminate with no street connection, but a future connection is planned or accommodated, a sign shall be installed at the location with the words "FUTURE ROAD CONNECTION" to inform property owners.
(4) Stub street terminations shall be designed to allow for adequate emergency vehicle access, including adequate turning radii required per local fire department standards for vehicular access.
(5) The Final Plat for Subdivision shall identify all stub streets and include a notation that all street stubs are intended for connection with future streets on adjoining undeveloped property.

## (C) Access to Individual Lots

(1) Access to Thoroughfares (Major and Minor)

Individual lots abutting major and minor thoroughfares are encouraged to achieve access through the use of shared driveways, alleyways, or parallel access streets. Direct access onto major and minor thoroughfares from individual lots with lot frontages of less than 300 feet is discouraged.
(2) Limited Access to Collector Streets

Unless no alternative means of access exists, such as alleys or parallel access streets, and it is unreasonable or impractical to require an alternative means of access, direct driveway access to collector streets shall be limited to lots containing multiple family dwellings, commercial, and industrial and related uses, provided that driveway separation of two hundred (200) linear feet or more per street side is maintained.

## (D) Sidewalks

## (1) Internal Pedestrian Access

All multi-family, public and institutional, commercial, and industrial and related uses shall provide at least one (1) improved internal pedestrian access to connect all new buildings to existing or planned sidewalks in the adjacent public right-of-way.

## 7. Bicycle Amenities

This provision requires bike racks to serve bicycle commuters for developments of a certain threshold and encourages development of additional bicycle facilities, such as on-site shower facilities, and bicycle-friendly drain grates.

## Sample Language

## (A) Bicycle Parking Requirement

All developments containing surface parking areas with 35 or more spaces shall provide bicycle parking facilities, which shall comply with the following standards:
(1) Bicycle parking spaces shall be conveniently located, but in no case shall such facilities be located farther than 100 linear feet from the primary building entrance;
(2) Bicycle parking spaces shall be provided at the following rates:
(a) One bicycle parking space per every ten off-street parking spaces within downtown and town center districts;
(b) One bicycle parking space per every 20 off-street parking spaces in all other districts; and
(3) Bicycle facilities shall include a rack or other device to enable bicycles to be secured; and
(4) All non-residential developments are encouraged to provide shower facilities for building users at the rate of $0.2 \%$ shower stalls per building occupant as measured at peak building activity periods.
(B) Drain Grates

Per FHWA guidelines, care must be taken to ensure that drainage grates are bicycle-safe. If not, a bicycle wheel may fall into a slot in the grate, causing the bicyclist to fall. Replacing existing grates with bicycle-safe grates (see A and B in figure below, preferred methods) or welding thin metal straps across the grate perpendicular to the direction of travel (see C in figure below, alternate method) is required. These should be checked periodically to ensure that the straps remain in place.

Note that grates with bars perpendicular to the roadway must not be placed at curb cuts, as wheelchairs could get caught in the slots. The most effective way to avoid drainage grate problems is to eliminate them entirely with the use of inlets in the curb face (see figure below). If a street-surface grate is required for drainage, care must be taken to ensure that the grate is flush with the road surface. Inlets should be raised after a pavement overlay to within $6 \mathrm{~mm}(0.25 \mathrm{in})$ of the new surface. If this is not possible or practical, the pavement must taper into drainage inlets so they do not cause an abrupt edge at the inlet.

## 8. Parking Fund Payments-in-Lieu

This provision includes an option for new developments to substitute payments into a parking fund for provision of some or all required off-street parking, with funds to be used to help fund improvements such as park-and-ride lots. These types of provisions are often used in downtowns and town center areas.

## Sample Language

Upon proposal by an applicant, the municipality may determine that a payment-in-lieu of providing required parking is an appropriate form of compliance with the off-street parking standards in this ordinance. When a payment-in-lieu is identified as an option, the payment amount shall be proportional to the cost of land and construction required to produce the required number of parking spaces. Payments so made to the municipality shall be used for constructing transportation-related improvements in the municipality.

## MODEL ORDINANCES

## 9. Transit-Oriented Development Standards

The following model ordinances provide examples for implementation of transit-oriented development districts and standards, such as minimum densities, transit-friendly building design/orientation, and walkways/bikeways in designated transit-oriented locations.

## Summary of Ordinance Provision

Chapel Hill, North Carolina has adopted a zoning district to be applied in areas intended for transit-oriented development (TOD). Land uses in the district are to be designed in a manner that reinforces transit use through increased densities, limit conflicts between pedestrians and vehicles, provide pedestrian amenities, and generally support transit use.

The TOD District is separated into two sub-districts:

- Transit-Oriented Development Core (TOD-C) can be designated in areas where $50 \%$ of the land area within the proposed district lies within $1 / 4$ mile of a transit station or bus boarding location.
- Transit-Oriented Development Periphery (TOD-P) can be designated in areas between $1 / 4$ and $1 / 2$ mile of a transit station or bus boarding location as long as it adjoins an area designated as TOD-C.

See the following link for the full TOD ordinance.
http://townhall.townofchapelhill.org/ABC/northern area/background/tod lumo extract.pdf

Huntersville, North Carolina, has adopted zoning districts for Transit-Oriented Development-Residential (TOD-R) and Transit-Oriented Development-Employment (TOD-E). The TOD-R district is established to support higher density residential communities that include a mix of retail, restaurant, service, and small employment uses within a pedestrian village format. The TOD-E is established to accommodate general office uses and offices support services in a pedestrian setting. Specific uses are allowed and allowed through a special use permit in each district according to the use's compatibility with the districts. Specific site design, block structure, parking, floor area ratios, and other design aspects are outlined in the ordinance.

See the following link for the full TOD ordinance.

## 10. Transportation Management Plan Requirements

This model ordinance requires all non-residential developments to provide employer-sponsored and managed Transportation Management Plans (TMP), to encourage employees and patrons to walk, bike, and take transit instead of relying on automobiles for mobility. Similar provisions could also be adopted to specify a threshold (e.g., developments that will employ 100 or more employees) that would trigger requirements for TMPs .

## Summary of Ordinance Provision

The Town of Chapel Hill requires a Transportation Management Plan (TMP) be developed as part of all nonresidential development proposals. The TMP is a stipulation of the Special Use Permit or Site Plan approval process and is submitted as part of the Zoning Compliance Permit. The following travel demand measures and incentives are recommended for inclusion in Chapel Hill's TMP:

- Subsidized transit fares, distribution of transit service schedule and other information;
- Staggered work hours and flextime programs;
- Installation of bicycle racks, lockers and shower facilities to encourage people to bike or walk to work;
- Informal rideshare matching program;
- Funding for programs such as purchase of bicycles for employee use;
- Installation of bus shelters and similar amenities to enhance transit use;
- Parking management program including parking charges or designated rideshare/carpool spaces;
- Installation of transit information display and its continued maintenance; and
- Other measures: lunchroom facilities, direct deposit of paychecks, and employee use of company mailroom facilities.

Other options for inclusion in a Transportation Management Plan program can include:

- Carpool drop-off areas
- Shuttle service to mass transit

See the following link for the full Chapel Hill TMP ordinance. http://www.ci.chapel-hill.nc.us/DocumentView.asp?DID=223

## OVERVIEW

## BACKGROUND

This is a report to the four member jurisdictions (Village of Marvin, Town of Weddington, Town of Waxhaw, and Village of Wesley Chapel) of the Western Union County Local Area Regional Transportation Plan (LARTP) Group. As part of one of the fastest growing counties in the country, these municipalities have undertaken a planning effort to address the impacts of rapid growth and proactively plan for the future. Together with the Centralina Council of Governments, the member jurisdictions of the LARTP Group have collaborated to create a unified transportation plan for the study area (see figure to the right). The intent of the planning effort is to develop a common framework for guiding future transportation and corresponding land use decisions within the four jurisdictions. This effort is timely and corresponds with the update to the Union County Comprehensive Plan, development of the Waxhaw Comprehensive Plan, and other local planning efforts.

## PURPOSE

One of the steps in this planning process is to assess the linkage between transportation planning and land use

Project Study Area planning in the study area and to identify ways to better coordinate planning efforts to achieve the desired goals in western Union County: decrease road congestion, provide safer roads and intersections, maintain rural character, provide safe routes for bicyclists and pedestrians, and others. The way in which the four towns and the county develop their land directly impacts the local transportation network, including roadways and alternative modes such as transit, bicycles, and pedestrians. For example, development along NC-16/Providence Road has led to a decrease in the level of service along this corridor, particularly during peak hours. This part of the planning process assesses different ways that these communities can manage land use to better use the existing transportation system and identifies public and private methods to improve and enhance the system.

For this initiative, the Steering Committee chose to look outside the study area and learn from the planning practices of other communities that have experienced similar growth and transportation issues. In particular, the committee suggested that the planning team learn more about transportation and land use planning in Matthews, Huntersville, and Cary, North Carolina, specifically focusing on new ideas and lessons learned that could inform the Steering Committee as it develops the implementation strategies for this planning effort. In addition, the planning team reviewed the development of the Ardrey Kell Road Corridor in Charlotte, NC. This report provides case studies from these communities focusing on a few key questions:

- How have these communities managed impending growth?
- How do they plan for and fund transportation infrastructure needs?
- How do they address the land use / transportation nexus?
- Have they been successful at accommodating growth and maintaining community character?

The final section of this report draws upon the lessons learned from these communities and provides implementation recommendations for the Steering Committee to consider.

## Matthews, NC Case Study

## BACKGROUND

The Town of Matthews is located in southeastern Mecklenburg County and borders the City of Charlotte, the Town of Mint Hill, and Union County (including the Towns of Stallings and Indian Trail). As part of an agreement each municipality in Mecklenburg County has with Charlotte, Matthews has a defined area, known as its Sphere of Influence, from which it can annex. The town's Sphere of Influence and ETJ (extraterritorial jurisdiction) share the same boundary, providing the town the ability to manage and plan for growth within its defined growth area. The town also has an annexation agreement with the Town of Stallings. Through the early 1980s, the town had predominantly relied on voluntary annexations, but by the mid-1980s it began using involuntary annexations to incorporate complete phases of developments at a single time. Through this process the town limits have grown substantially since 1986.

Matthews experienced a wave of growth in the 1980 s and 1990s. The town's population in 1980 was $1,648$. By 2000 it grew to 22,127 and continues to grow, although at a slower rate. This growth coincided with the location of several major employers locating in the area. The majority of land in the community is dedicated to residential uses, with commercial and employment uses located along the main road corridors, such as Independence Blvd/US-74, Trade Street, and Pineville-Matthews Rd/NC-51. While the town has not reached full buildout, it has few remaining parcels left to develop, often with significant transportation and environmental constraints.

Matthews experienced a wave of growth in the 1980s and 1990s, providing almost two decades of planning to learn from.

The town's land use planning is guided by its 2002 Land Use Plan. This is a policy-based plan that is implemented by amendments to the zoning ordinance. The town has plans to develop a Future Land Use Plan in the fall of 2009 and is currently undertaking an update to its Unified Development

The NC-51 Corridor has been identified by Matthews as a priority for protecting traffic flow and the natural environment. Ordinance. Matthews recently adopted bicycle and pedestrian plans. The town adopts the MUMPOs (Mecklenburg-Union Metropolitan Planning Organization) Thoroughfare Plan as its own and uses this to guide road planning. Much of the town's current transportation planning efforts focus on creating better connectivity in developed areas, such as retrofitting downtown to provide better accessibility and mobility, improving existing roads, and providing more pedestrian and bicycle facilities.

The Land Use Plan focuses on the connection between land use and transportation planning in key corridors. Through its zoning ordinance, the town has focused higher traffic volume commercial and employment development to main transportation corridors. Public support is critical to these efforts. When there was no support for the proposed Sardis-Weddington Connector because it would bisect existing residential neighborhoods, the town built an alternative - Fullwood Road. Recently, the town has focused attention on the transportation and land use planning along the NC-51 corridor. This corridor has rerouted traffic around the north side of downtown, providing easy access from businesses and neighborhoods to an I-485 interchange and away from downtown. The town's Land Use Plan (2002) identified this as a priority focus area for protecting traffic flow as well as the natural environment found in the corridor.

A light rail transit line paralleling the existing railroad line and connecting into Uptown Charlotte has been discussed for many years. Several studies have been conducted for the Southeast Transit corridor. Currently, the transit planning continues and may eventually result in a new light rail line or a BRT (bus rapid transit) line linking Matthews to Charlotte.

## Planning Practices

Matthews employs several land use planning tools that reinforce transportation planning objectives.

## Special Highway Overlay Zone

To protect the traffic flow and the natural character along the NC-51 corridor, the Town of Matthews adopted a Special Highway Overlay Zone. This zoning district acts as an overlay on top of the base zoning districts that lie in the corridor and includes more restrictive measures for lands within the district. The boundary for the district is tied to the designated right-of-way as identified in the town's Thoroughfare Plan. As the plan is updated and right-of-way is expanded, the overlay zone is also amended. Provisions in the overlay zone include the following.

Properties within a $50-1000$ buffer of the road right-of-way along NC-51 are regulated by Special Highway Overlay Zone provisions.

- Natural Areas Protection. The purpose of this provision is to provide a natural
protective buffer area on both sides of the roadway to reduce the visual impact of development in the corridor and protect natural areas. All properties within the overlay zone are required to have a natural buffer area along the NC-51 road frontage. This buffer, or setback, ranges from a 30 foot to 25 foot buffer, depending upon whether it is accessed directly from the highway ( 30 foot) or by a service road ( 25 foot). All streets that connect to NC-51 are also required to have a 25 foot natural buffer within the overlay boundary.
- Landscaping. All non-single family developments within this area are required to develop a landscaping plan for areas within the protected buffer area and interior to the development. The ordinance provides specific provisions for the type, size, and location of landscaping materials that are used in both locations. Trees within the required protective buffer area that are of a certain type and measure either 3 caliper inches or 4 feet in height or greater are required to be protected. In addition, a 20 foot buffer is required of all non-residential uses abutting a residential use or zoned area. The landscaping must buffer the uses with at least a $75 \%$ opaque year round landscaping material. The ordinance provides specific options for complying with this provision.
- Access Control. Access control refers to access management. This provision limits the number of driveways and streets intersecting the road with the goal of having no more than one per every 500 feet. Given the fact that some parcels have less than 500 feet of road frontage, the minimum required distance between driveways is 200 feet. The town encourages landowners of adjacent smaller lots to develop plans to share driveways. In some instances, these driveways can be larger than a single driveway permit allows, depending on NC-DOT approval.
- Land Use. Land uses within the corridor are the same as those allowed under the base zoning district. Towards the center of the town, these uses are primarily commercial, employment and multi-family with lower-density residential uses at the periphery.
- Impervious Surface and Stormwater Management. Development within the overlay zone is limited to an impervious surface (rooftops, walkways, and paving) of $75 \%$. Stormwater retention is required on all lots.
- Parking. Parking for all non-residential sites in the overlay zone has to be located to the side and rear of all principal structures. Parking cannot be any closer to the highway than the principal structures on the lot or 60 feet, whichever is less. Applicants can apply for exemptions and specific conditions for exemption are outlined in the ordinance.

## Conditional Zoning

The Town of Matthews has been given the authority by the N.C. General Assembly to use conditional zoning. Under this statute, the town's zoning ordinance can include conditional districts in which site plans and individual development conditions are imposed. Conditional zoning allows local governments to tailor development regulations when rezoning to a more intensive land use. This zoning tool provides an opportunity for the town to negotiate with developers to require better access management, connectivity with adjacent uses and roadways, greenways, sidewalks, road improvements, and other features within the development.

In North Carolina, land may only be placed in a conditional zone upon petition by all landowners to be included in the rezoning. The enabling statute limits the types of conditions that may be imposed on the new zone to (1) those that address the conformance of the development and use of the site to city or county ordinances and officially adopted plans, and (2) those that address the impacts reasonably expected to be generated from the development or use of the site. To comply with N.C. statutory provisions, the local planning board must state in writing how the rezoning to a conditional zoning district complies with the municipality's comprehensive plan and the deciding body must state its reasons for voting to rezone to a conditional zoning district. The conditions agreed to by the petitioning landowner(s) are then legally binding on both the landowner(s) and local government, providing stability for the landowners' investment interests. ${ }^{1}$ Matthews has agreed to conditional zoning for residential, business, office, and industrial zoning districts. This tool allows the town greater flexibility in meeting their community goals as outlined in their land use, bicycle, and pedestrian plans.

## Thoroughfare Plan

Once a roadway is included within the town's Thoroughfare Plan, the town can then use this plan to require dedication of right-of-way as part of the development approval process. Existing and proposed major and minor thoroughfares are designated on the town's zoning map to further reinforce the importance of these roadway corridors. Using the conditional zoning process, the town can also request that the developer convey land to the town and construct portions of future thoroughfares.

Hatch marked lines designate proposed minor and major thoroughfares near the new СРСС campus in southern Matthews near I-485.

## TRANSPORTATION FUNDING

Matthews has historically had political and community support to fund transportation improvements with local funding.

- Bonds. In 2004, Matthews passed a local bond referendum to allocate $\$ 5.5$ million for specified road projects and $\$ 5$ million for park \& recreation projects.
- Funding Partnerships. Matthews has joined Mecklenburg County to finance development of a two mile segment of the 4-Mile Creek greenway. This project has been ten years in the making and will connect an elementary school, a community center, Squirrel Lake Park, Trade Street near Arthur Goodwin Park, and a neighborhood through the protection and enhancement of 4-mile creek stream buffers.
- Dedicated Annual Funding. For a number of years, Matthews has dedicated general fund revenues annually to construct one sidewalk project along a main corridor. In conjunction with sidewalks built as requirements of new development, this funding source has helped to build a network of sidewalks, particularly focused on filling in the gaps between sidewalk segments developed as a condition of new development.

[^1]- Tax Increment Financing (TIF). The town is now considering use of a TIF to fund road and streetscape improvements in designated areas of town. In addition, developers are considering using a synthetic TIF to fund property improvements. Developers would borrow against the future taxes paid on a property, assuming a certain property tax value in the future. This is a tool that is not used in many communities in North Carolina and should be fully vetted before entering into such an agreement.

## LESSONS LEARNED

Three decades of land use and roadway planning in a high growth environment have led to many lessons learned in Matthews.

- Plan now - implementation takes much time and effort.
- Road projects have been a stimulus for new development. Whether proposed or under construction, new roads and connections necessitate changes in zoning and land use policies to manage development and maintain levels of service.
- Start public improvement projects as soon as possible; costs will almost always increase the longer you wait to break ground. The main road project funded by the 2004 bond was stalled and is now estimated to cost more than double the original estimate.
- Local governments should understand what the state can and will do to improve the local transportation system and the timeline for those improvements. Any other priorities should be taken up locally.

Matthews Downtown Master Plan designates "conceptual intersections" with circles where new road connections will be made in the future.

- A comprehensive transportation plan that includes bikeways, pedestrian paths, roads, and transit is ideal. This coordinates all of these modes into one document and makes it easier to understand, easier to set community priorities, and easier to work with developers to negotiate development exactions.
- Connectivity is the key to a healthy transportation system. The town is working to create more connectivity in already developed areas, such as the downtown. The downtown master plan identifies locations for new intersections and the town is using this to work with landowners to develop new connector roads.

## Huntersville, NC Case Study

## BACKGROUND

The Town of Huntersville is located in northern Mecklenburg County south of Cornelius and north of Charlotte. It lies along I-77, just twelve miles north of Charlotte's center city. Once an agricultural community with a small textile mill and a commercial area along the railroad, Huntersville has grown significantly, expanding its planning jurisdiction (ETJ) and corporate limits to include approximately 64 square miles. The town's growth in population has been significant in the last two decades. In 1990, its population totaled 3,014 . This grew to 24,960 by 2000 and current studies estimate the town's population at 44,500 . Residential development in the town has almost doubled since 2000. Like Matthews, Huntersville partnered with Charlotte to adopt an annexation agreement that designates the town's growth area. The town has adopted a similar agreement with the Town of Cornelius. Approximately 12\% of the town's planning area is within its ETJ and is generally more rural in character. Huntersville has considered annexing the balance of its jurisdiction and currently accepts voluntary annexations from within its ETJ.

The main road corridors of I-77, US-21, and NC-115 run parallel and north/south through the central areas of town. The majority of development within the community is located along these main corridors. More rural areas in the ETJ straddle the urbanizing areas to the east and west. The town has made a concerted effort to focus and guide development along the central parts of the community to develop more sustainably, build on the city's historic development pattern in a way that provides density for future transit use, and to preserve rural areas to the east and west. The town's fundamental planning principles focus on the following.

- Proactively guiding development in a sustainable and efficient manner by creating an "edge" which marks the line between "town" and "country".

- Concentrating higher-density development where existing highways and future rail lines are located to ensure an efficient transportation system and proximity to centers of activity.
- Employing traditional town planning principles that promote new and infill development in the town's urbanized area, anchoring the town on a proposed rapid rail corridor along the north-south rail spur.
- Planning for streets as the fundamental building blocks of the community to create an interconnected system that offers inviting public places and that respects the pedestrian and accommodates the automobile.
- Developing a transit-supportive community that offers many options for mitigating traffic and moving throughout town and the larger region.
- Viewing each new development proposal within the larger context including its impacts on the transportation network and other public facilities.
- Requiring a high-quality built environment that includes excellence in building design, streetscapes, pedestrian amenities, preservation of special places, and enhancement of community distinctiveness.

The traditional town planning approach focuses development towards the center city areas near main road and rail corridors and away from rural areas on the periphery of town.

Land use and transportation planning are always undertaken simultaneously in Huntersville. A Community Plan provides the overall vision for the community and a series of small area plans provide the framework for guiding growth, design, and public improvements in targeted corridors. Like Matthews, Huntersville does not have a town-wide future land use plan and instead implements the recommendations of its 12 small area plans directly into its development ordinances. This "quilt" approach to planning has enabled the town to create highly detailed plans for targeted areas in the community. The town takes a unique approach to encouraging density - it has no density caps in areas targeted for development, such as in downtown, transit oriented development locations, and neighborhood residential areas. Instead, the town relies on the market and local culture to determine what density of development is appropriate. The town has been happy with the products of this approach Montreat Park, Rosedale, and Birkdale Village are all higher density mixed-use developments that achieve community goals.

In 1996, the Town of Huntersville revised its development ordinance to employ the principles of traditional town planning. The ordinance is both a performance based and form based code that contains urban design standards, such as requiring that buildings face the street and are accented with sidewalks and street trees. The zoning ordinance includes nine general districts: three residential districts, three mixed-use districts, and three commercial districts.

The town's approach to transportation focuses on expanding multi-modal opportunities and dispersing traffic by emphasizing the connectivity of streets so that travelers may have multiple routes to destinations. In 2007, the town adopted a Comprehensive Transportation Plan that incorporates its thoroughfare plan, greenway, bicycle, and pedestrian plans into one. As new regional plans are developed, Huntersville adopts MUMPOs thoroughfare plan as its own. Huntersville is currently partnering with Charlotte and the five other municipalities in Mecklenburg County to develop an integrated transit/land use plan for rapid transit.

## PLANNING TOOLS

## Transportation Planning Resources

Huntersville has made a concerted effort to conduct local level transportation planning and to provide staff capacity to undertake these efforts. The town hired a transportation planner in the 1990s as development activities began to increase. The town also employs a traffic engineer who was formerly with the Charlotte Department of Transportation and a principal planner that serves as a liaison between land use and transportation planning. The town develops an annual list of priority transportation improvement projects. In 2008 , the town identified ten priority projects and completed five. This year the town has expanded that list to include sixteen priority projects. Decisions on transportation improvements made by the town are guided by a methodology that identifies the amount of funding that will be applied to various types of projects (i.e., maintenance, new roads, pedestrian facilities, etc.)

Small area plans guide development and design along targeted corridors in Huntersville.

## Development Review - Focus on Transportation

The Town of Huntersville uses three planning tools to exact transportation improvements from private developers during the development review process and to guide the specific designs of these improvements. These tools include the Streets section of the Huntersville Zoning Ordinance, the town's Thoroughfare Plan, and the town's Transportation Impact Assessment Ordinance.

- The Streets section of the Huntersville Zoning Ordinance focuses on street connectivity and designing streets to provide a pedestrian-scale environment that is conducive to walking and biking. Provisions within the ordinance are designed to address rural and urban environments differently. For example, urban type districts are required to provide sidewalks on both sides of the street and in rural districts, sidewalks may only be required on one side of the street.

## Boulevard <br> 

Huntersville's Zoning Ordinance provides illustrations of street crosssections that specify the exact configurations of street improvements by type of road. A boulevard cross-section is shown here.

- The town uses its Thoroughfare Plan as an official map that designates where future road, bike, pedestrian, and greenway improvements will be made. If a developer has proposed a development on a site that includes portions of a future road, the town will require, at a minimum, that the road right-of-way will be reserved. Another option is for the landowner to designate the right-of-way and convey the land to the town. A final option is for the landowner to convey the land and develop the transportation infrastructure.
- Adopted in 2008, the town's Transportation Impact Assessment Ordinance sets out specific provisions for 1) the assessment of transportation impacts from new developments that are expected to generate a minimum number of vehicle trips within a defined impact area, 2) the level of service that is required on roadways within individual zoning districts, and 3) the forms of mitigation that are to be employed to maintain the existing level of service on impacted roadways. This ordinance provides the town with an opportunity to assess more holistically the transportation impacts that a single development can have on the transportation system.

The Transportation Impact Assessment Ordinance requires that all developments that are expected to generate 50 or more peak hour trips or an average daily total of 500 or more trips (based on the current edition of the ITE Trip Generation Manual) to conduct a transportation impact assessment of the project. Based on the size, type, and uses within the proposed development, an "impact area" is defined. This impact area identifies the segments of the road network that will be assessed for impacts from the development. These assessments take into account any planned travel demand management techniques employed in the project. For example, a mixed-use project may actually receive a credit (i.e., increase road capacity estimates) for a roadway in the impact area as many residents will have access to uses that will not require vehicle trips. For redevelopment projects, the transportation impact assessment focuses on new trips generated by the development.

The town has established minimum levels of service (LOS) for roads by zoning district, ranging from "C" (better flowing traffic) to "E" (more traffic and less flow). The town center and transit-oriented development district have an LOS "E," the rural and traditional residential districts have an LOS "C," and all other districts have an LOS "D". This may seem counter-intuitive as the town has essentially allowed for lower levels of service in areas of higher density development and intensive road use; however, this is by design. These levels of service help to reinforce the town's vision for land use by encouraging development to occur in the central areas where road mitigation requirements are less costly and transit will be provided in the future, and discouraging it from occurring in the rural areas where road mitigations requirements may be more costly. Mitigation is a requirement of development approval if the TIA results show a decrease in LOS in the impact area. Mitigation can come from the developer in the form of the provision or funding of

| LARTP Land Use and Transportation Planning Case Study Report Clarion Associates |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |

pavement widening, turn lanes, median islands, access controls, traffic signalization, or other improvements. It is important to note that LOS standards are set based on the existing level of service in the town. If the town wishes to improve the LOS on a roadway, it can not require a developer to mitigate beyond the established LOS. However, the town can work with the developer to make improvements that will increase the LOS, and will likely require public investment.

## Design Guidelines

Huntersville's Design Guidelines Manual bridges the gap between the standards outlined in the town's Zoning Ordinance and the vision expressed in the town's plans. It provides a graphic representation that complements the zoning ordinance and helps to interpret its regulatory provisions. Examples of design recommendations included in the Design Guidelines Manual include the following.

- Connectivity should be created within and between developments. The zoning ordinance requires street stubs to be built to adjoining properties.
- Streets should be enclosed by buildings to create public spaces. The setbacks of buildings from streets will be dependent upon the context (downtown, neighborhood, rural, etc.) Larger setbacks can be allowed in urban settings as along as a row of maturing street trees aligns the edge of the street.
- Parking should be placed behind or to the side of buildings.
- Buildings should be designed to respect the human scale, including the character of pedestrian entrances along streets. Any uses that disregard the human scale should be buffered, such as big box retail, commercial communication towers, junkyards, outdoor storage, etc.
- The Rural District (R) encourages the development of neighborhoods and rural developments that set aside significant natural vistas and landscape features for permanent conservation. Development types associated with the Rural District are farms, the conservation subdivision, the farmhouse cluster, and the residential neighborhood.

## TRANSPORTATION FUNDING

The Town of Huntersville has invested a significant amount of resources to transportation and land use planning, including the development of 12 highly detailed corridor and small area plans, hiring professional transportation and land use planning staff, and public investments in transportation infrastructure. The town has partnered with the North Carolina Department of Transportation to assist in roadway building. Development of the full NC73 roadway, a strategic east-west corridor in the town, was on the town's Thoroughfare Plan. In 2005, the town wished to pursue development of NC-73 roadway segments; however, the North Carolina Department of Transportation didn't have the funding at the time to move forward with the project. The town provided bridge funding to the state allowing them to develop the road and was later reimbursed through state transportation funds. A local developer also contributed money to the development of this road. Currently, the town has a project that is high on the list of potential federal stimulus package projects. The town is also considering using bonds to pay for priority road improvements.

## LESSONS LEARNED

A focus on the land use and transportation nexus in Huntersville has provided many learning opportunities. Lessons learned from these experiences include the following.

- If a local government doesn't designate where dense development will go, then it will likely result in a haphazard development pattern that may impact the character of the community. The best way to preserve areas within a community is to have alternative choices for more dense development to locate and to set up zoning ordinance and road planning to reinforce that model.
- Developers don't wait for a thoroughfare plan to be adopted. It is important to put in place a thoroughfare plan and amend local ordinances accordingly to ensure that developers will provide their fair-share of needed improvements.
- Make sure that all plans become a reality. Huntersville has a good success rate at taking recommendations from small area plans and incorporating them into local ordinances.

Density is focused in the central core of the town proximate to main thoroughfares and away from the rural areas on the periphery.

- Build in the linkage between

Road standards in Huntersville include wide shoulders or bike lanes and sidewalks on both sides of the road. transportation and land use planning in town plans and reinforce this linkage through staff responsibilities.

- Pick transportation improvement priorities and focus on them. Don't bite off more than you can chew or it will likely lead to a low success rate.
- Always think about the long-range impacts of decisions. Community opposition to street connectivity between several neighborhoods in Huntersville led to the town not requiring these connections. Now some residents have limited access and have to drive more than a mile of neighborhood streets to get from their home to a main roadway. This is not only an inconvenience to residents, but delays response times of emergency responders to these areas.
- It is critical to work with the county to develop consistent standards for development that may one day be within municipal limits.

## Cary, NC Case Study

## Background

Cary is located in the heart of the Research Triangle metropolitan area near Raleigh, Durham, and the Research Triangle Park (RTP). Cary's proximity to these employment centers, three prominent universities, freight and passenger rail, and to interstates and regional thoroughfares, has led to significant growth over the last two decades. The town had a population of 25,000 in the early 1980 s. By 1990, the population had almost doubled to 43,000 . Current estimates project that the town's population is more than 132,000 .

In the 1980s, Cary qualified for a three mile ETJ extension that expanded the planning jurisdiction of the town to the west of NC-55 to include historically rural/agricultural areas. Many landowners within this area were opposed to being within Cary's jurisdiction and wanted to maintain the rural community character west of town. In 2000, Cary and other municipalities in Wake County participated in a joint planning effort that set out primary and secondary growth areas for the municipalities and strategies for coordinating extension of services and transportation improvements. This regional planning effort has been a critical step at managing growth within Wake County. Today, the town is essentially "landlocked" by neighboring jurisdictions and the Swift Creek Land Management Area, an impaired stream corridor.

Cary uses a tiered system of plans to direct growth and development in the town. In 2000, the town adopted a community-wide Growth Management Plan that provides goals and policies for directing several aspects of growth in the community: 1) rate and timing, 2) location, 3) amount and density, 4) cost, and 5) quality. This document provides the policies and implementation
 strategies for coordinating the provision of public facilities and services with new development. The town's Land Use Plan, adopted in 1996 and revised in 2003, articulates goals and objectives for development in the town. Like Huntersville, the town's land use plan focuses on creating a density transition from the more dense central parts of the community to the more rural areas towards the west. This plan is further expanded through several small area plans that focus on quadrants of the town. This case study focuses on the Southwest Area Plan that includes areas within the town's corporate limits and ETJ that have historically been more rural in character and are bound by areas just east of NC-55 westward to the Chatham County border. This area is the focus for several large transportation improvements: the development of the l-540 corridor, three l-540 interchanges, and road improvements to provide capacity for projected traffic flowing through the region.

Cary is the third largest member of the Capital Area Metropolitan Planning Organization (CAMPO). Using CAMPO's regional transportation planning model, Cary undertakes its own transportation planning and analysis to develop plans for transportation system improvements. In 2001, the town adopted a Comprehensive Transportation Plan that includes all modes of transportation, including greenways and bike lanes. These plans were then incorporated into CAMPO's Long Range Plan. The town is currently in the process of updating its Comprehensive Transportation Plan and will include pedestrian, bicycle, transit, and street elements.

## Planning Tools

## Southwest Area Plan

The Southwest Area Plan (SWAP) is a master plan for more than 5,700 acres in the southwestern portion of the Town of Cary's planning area. This plan is a policy document which establishes the long-range vision and recommendations for future land uses, transportation, parks, open space, and the environment in that area. This area lies within a geologic region which contains soils that are poor in permeability, limiting the application of septic systems in some locations. Much of the nine square miles within the planning area have historically been in agricultural use with rural homes and farmsteads. The largely undeveloped Green Level area lies within the planning area. This is one of the last expansive rural landscapes in the vicinity of the Research Triangle Park. It is one of three historic districts within Cary's planning jurisdiction that are on the National Register of Historic Places.

Driven by community concerns for the area, the focus of the Southwest Area Plan is to preserve rural character in the community and to protect natural and cultural resources, such as the Jordan Lake watershed. The plan focuses services and development around NC-55 and I-540, the main north-south corridors in the planning area, located in the eastern portion of the planning area and away from more rural areas to the west. It sets out a density gradient that transitions from higher density land uses in the east to rural density land uses in the west.

The American Tobacco Trail serves to some extent as an urban growth boundary on the western side of the planning area. All areas west of the trail

The original vision for the Southwest Area Plan was to maintain rural character. Development of suburban subdivisions in the area has changed the area and may require a new land use planning approach. are slated to remain rural. The plan is complemented by the Rural Landscape Preservation Project -- an effort to identify key natural and cultural areas for protection and to educate landowners on the tools available to them to protect the important character of their lands.

The Southwest Area Plan sets out several implementation actions that the town has undertaken. One of the most critical steps for protecting rural areas was the adoption of the Conservation Residential Overlay Zoning District which includes three subdistricts. This ordinance is applied on top of the R40 base zoning district that results in a density of one acre or less. The three overlay zoning subdistricts include:

- Conservation Residential - Low Density (1.0 acre gross density),
- Conservation Residential - Very Low Density ( 0.5 acre gross density), and
- Rural (0.5 acre gross density).

New clustered subdivisions in southwest Cary do not have curb, gutter and sidewalks, and instead use swales to manage stormwater runoff.

The overlay zoning district provided an alternative to the traditional subdivision often called the "Conservation Subdivision." With this new tool, developers can increase their net yield on a property for permanently protecting primary and secondary open spaces. In addition, developers must incorporate low-impact development and stormwater best management practices (such as swales and rain gardens) in their developments. For every acre of primary open space protected, developers can develop between 5 and 10 additional units, depending on the quality and character of the open space. For every acre of secondary primary open space protected, developers can develop 5 additional units. Because the ordinance includes a maximum gross density for each of the three overlay subdistricts, this limits a developer's ability to actually develop all the bonus units available. The town is currently working to amend this provision to make the ratio of open space to bonus units more feasible.

The plan also called for new town standards for thoroughfare and collector road design to permit the construction of "rural collectors" and "rural thoroughfares" within the planning area. These alternative designs call for collector and thoroughfare roadways to be built without curb and gutter or sidewalks in order for the roadways to be more compatible with the existing rural landscape and to use low-impact development techniques to manage stormwater runoff along roadways. Greenways and wide shoulders on rural collectors and thoroughfares provide transportation alternatives in this area.

When the Southwest Area Plan was being developed, many landowners were not interested in selling or subdividing their property for new development and the focus was on maintaining rural character in this area. Times have changed, and many landowners are now more interested in developing their properties. Much of the new development that has been built in this area has resulted in a more suburban type character. The vision for the area may be changing. This area is no longer experienced as solely rural and is becoming more suburban in character with each new residential neighborhood. Staff planners determined that what most residents want in the area is not necessarily rural development, but to limit visibility from the main thoroughfares into new residential developments. The town is considering adoption of an 80 foot streetscape buffer from thoroughfares to achieve this goal. If adopted, front setbacks would be applied in addition to the streetscape buffer. There are concerns that at some point in the future, existing neighborhoods will want suburban amenities, such as sidewalks and street lights. If this occurs, the town will have missed its chance to have developers assist in the development and construction of these types of amenities.

## Transportation Funding

Because CAMPOs funding cannot pay for all of Cary's priority projects, the town has found it necessary to provide funding to build roads and make improvements to achieve its transportation

Developers add wide shoulders along rural collectors and thoroughfares in the Southwest Planning Area to provide an opportunity for bicyclists to share the road.
goals. For example, the town has invested in a red light synchronization system that improves traffic flow and has widened and built sections of road that link developer built segments. The town has used bonds and general funds to make these improvements. When Davis Drive, a road exiting off of I40 , needed widening and the state didn't have the funds to undertake the project, the town lent the state the money until such time that it could pay back the town from state transportation funds.

There are three main sources from which the Town of Cary receives funding or transportation improvements from developers: exactions at the time of rezoning, adequate public facilities exactions, and impact fees.

- Exactions. Developers are required to dedicate right-of-way to the town for any planned transportation improvements shown on the town's Comprehensive Transportation Plan and to construct these improvements. This is often called a developer exaction.
- Adequate Public Facilities Ordinance. In addition, the town has an Adequate Public Facilities Ordinance. This ordinance requires that adequate public transportation facilities are in place to service a new development before it is constructed, often in the form of traffic signal and intersection improvements. This ordinance is applied by zone and may result in a developer making improvements to move forward with their development if an area is underserved.
- Impact Fees. The town also has authority from the North Carolina General Assembly to assess road and water/sewer impact fees on new developments. These fees are determined based upon an impact fee methodology that generates the number of new users that will require water/sewer and road capacity. Fees are then applied to offset those impacts. This is a tool granted to only a few municipalities in the state.

## LESSONS LEARNED

Lessons learned from land use and transportation planning in Cary include the following.

- Development will happen. Communities need to be realistic about what type of development you want, what you want it to look like, and where you want it to go. The community's land use plan and ordinances need to reinforce the vision. The original vision for the Southwest Area may be changing based on changing property owner interests and the type of new development in the area.
- Reducing development densities along some roadways will not necessarily reduce future capacity demands on the road. During the Comprehensive Transportation Plan update process, the town identified regional transportation impacts along main thoroughfares, such as NC-55, that would require road improvements. The community supported dropping the density of development along the corridor to reduce demand on the road. Because the majority of traffic through this area is regional commuter traffic, lowering development densities had little effect on improving road capacity.
- It is critical to work with neighboring jurisdictions to plan for areas of joint interest. Part of south Wake County abuts Cary to the east. This area has particularly good soils and many subdivisions have been developed under the county's R-40 zoning. The original plan for this area was rural, but current development patterns are more suburban in character. Some of these areas are now within the town's planning jurisdiction and the town is now left with trying to retrofit rural roads and infrastructure to meet evolving suburban expectations.
- Impervious surface is something to consider when trying to articulate what "rural" means for a

Residential development in south Wake County may be more suburban than originally intended. community. Communities are wise to think not just about minimum lot sizes and low-impact development techniques, but should also think about the amount of hardscape within a development and how it will affect the character of the area.

- When developing clustered subdivision alternatives, make sure that bonus densities are feasible given all the developments standards (i.e., setbacks, minimum lot size, etc.) This is an excellent tool for protecting critical open spaces, stream corridors, and historic properties. However, developers may not use the tool if density bonuses cannot be realistically achieved. Also, make sure that the required ratio of bonus densities to protected open space will have the result that is intended. Cary learned that the conservation subdivision option did not result in protection of enough open space and that it is now hard to distinguish these developments from conventional subdivisions. The proposed revised ordinance lowers the density bonus in order to achieve more open space protection.

## Ardrey Kell Road (Charlotte, NC) Case Study

## BACKGROUND

Ardrey Kell Road is an NC-DOT maintained two lane road in southeast Mecklenburg that runs east-west between NC-16/Providence Road and Bridge Hampton Club Drive, just north of the LARTP study area. The road connects US-521 and NC-16 and has intersections with Tom Short Road, Rea Road, and Community House Road. It is estimated that the road carries 10,000-15,000 vehicles per day. Ardrey Kell serves one regional park, two Charlotte-Mecklenburg schools, four shopping centers and approximately 2,000 dwelling units. Speed limits along the roadway range from $35-45$ miles per hour.

Development of the road was a priority for Charlotte-Mecklenburg. Ardrey Kell was completed in 2002 and links several individual road segments, many built by developers of large tract residential neighborhoods along the corridor. The county's "hook" for rezoning approvals along the corridor was developer investment in road corridor improvements.

Following Charlotte's centers/corridors/wedges land use planning approach, the corridor has been designed to cluster non-residential development at specific nodes or intersections as opposed to strip commercial development with undifferentiated retail along the corridor. Many of the neighborhoods along the corridor are designed to connect

Sidewalks built by the developer are used by local residents. Street trees and bike lanes line the corridor and provide a buffer between pedestrian areas and the road.
to adjoining roads and neighborhoods, creating greater connectivity throughout the corridor.

MUMPOs Thoroughfare Plan calls for Ardrey Kell Road to extend across Providence Road to Kelly Morris Road. The right-of-way for this segment of the corridor is not yet dedicated to NC-DOT.

## DESIGN

Roadway design standards along Ardrey Kell include the following.

- "Build to" instead of "setback" requirements for commercial development along the road.
- Right in / right out (no left turns) access at some intersections, such as Ardrey Kell and Marvin Road.
- Sidewalks are built by the developer. They are frequently used and link neighborhoods to destinations like schools and commercial centers.
- Street trees and sidewalks line much of the corridor. $95 \%$ of it has paved shoulders or bike lanes.
- Preserved mature trees and natural swales protect the rural character along the corridor.
- Commercial sites are internally accessed.
- East of Rea Road, right-of-way is preserved for future road widening.
- The 3-lane cross section is common. It preserves capacity and may reduce accidents.

## LESSONS LEARNED

The greatest traffic problems along the corridor are located at Pineville-Matthews Road and Rea Road where cul-de-sac neighborhoods have only one main road that funnels neighborhood traffic to Ardrey Kell. This creates public safety concerns if this access point becomes blocked.

The 3-lane cross section preserves capacity and may reduce accidents.

Internal access to commercial developments allows free flowing traffic along the corridor. Note that the road is still only 2-lanes at this intersection.
 as buffer yards for adjacent developments. Mature trees are protected along the corridor.

## RECOMMENDATIONS

Based on the current conditions in the LARTP planning area and consideration of the land use and transportation planning tools outlined in this report, the planning team recommends that the LARTP Steering Committee consider including the following strategies as part of the LARTP implementation program. It is recommended that these standards should be consistent throughout the planning area and be adopted by all participating jurisdictions.

1. Upgrade access management standards (e.g., requirement to have shared driveways on adjacent lots, required stub-outs to vacant property when land is developed).
2. Require Transportation Impact Assessments and mitigation for projects generating a threshold number of trips.
3. Require dedication of right-of-way and construction of improvements as conditions of development approval, including construction of sidewalks and bike lanes/wide shoulders.
4. Adopt development standards that require:

- Internal access for commercial developments located at nodes or intersections, along with connectivity to adjacent developments.
- Encourage/require stub-outs of residential streets to undeveloped adjacent properties, along with notification provisions for purchasers of property and/or posting of signs.
- Limited use of cul-de-sacs.
- Tree protection requirements along major arterials to include:
o Required identification of significant trees and tree stands.
0 Enhanced requirements for vegetative buffers along major arterials (wider buffers, with enhanced preservation/planting requirements).
o Enhanced provisions for protection, during construction, of trees identified for saving.

5. Prepare corridor overlay zoning districts for key roads that traverse multiple jurisdictions. Include baseline standards to be considered for adoption by each jurisdiction involved.
6. Work with the Charlotte Area Transit System to identify locations for park and ride lots, and pursue funding options to develop such lots in advance of future transit.
7. Work with NCDOT to enhance coordination of signal timing.
8. Identify changes to future land use patterns that would enhance use of transit and possibilities for shortening / combining automobile trips.
9. Work with the Union County School System to identify sites for new school facilities that will avoid adding peak-hour congestion to already congested areas, and that offer opportunities for walking / biking to school.
10. Encourage mixed-use development in key locations, such as downtown areas and activity nodes.
11. Consider formalized joint planning activities with neighboring jurisdictions to coordinate development activity and share information.
12. Develop small area plans and corridor plans to study land use and transportation issues at a more detailed level.
